Dynamic Patterns In Communication Processes:

Dynamic Patterns in Communication Processes James H. Watt, 1996-05-13 While there is general acknowledgement that communication is a process rather than a condition there has been little systematic examination of dynamic processes within communication studies This volume examines these processes within the communications field as a whole from interpersonal to mass communication and thereby brings to light many largely unexplored connections The first part focuses on the methodological and theoretical significance of communication events or states which vary regularly or in some distinct pattern over time The second section is a compilation of current theories and research based on the ideas of cyclic and dynamic patterns which occur in diverse communication settings

De Gruyter Handbook of Media Psychology Rachel L. Bailey, Glenna L. Read, 2025-10-05 This book presents a survey of contemporary research investigating the psychological processes related to media consumption As a rapidly growing and changing sub discipline of mass communication Media Psychology analyzes how media facilitate communication and how communication in turn shapes attitudes emotions and behavior The handbook addresses leading ideas and debates in media psychology persisting lines of inquiry and new areas of interest Adopting an organizational approach that embraces a dynamic systems perspective the book is subdivided into sections that examine nested components of the larger system in question such as audiences messages content and context while also acknowledging that they do not function in isolation

Dynamic Speech Models Li Deng, 2022-05-31 Speech dynamics refer to the temporal characteristics in all stages of the human speech communication process This speech chain starts with the formation of a linguistic message in a speaker's brain and ends with the arrival of the message in a listener's brain Given the intricacy of the dynamic speech process and its fundamental importance in human communication this monograph is intended to provide a comprehensive material on mathematical models of speech dynamics and to address the following issues How do we make sense of the complex speech process in terms of its functional role of speech communication How do we quantify the special role of speech timing How do the dynamics relate to the variability of speech that has often been said to seriously hamper automatic speech recognition How do we put the dynamic process of speech into a quantitative form to enable detailed analyses And finally how can we incorporate the knowledge of speech dynamics into computerized speech analysis and recognition algorithms The answers to all these questions require building and applying computational models for the dynamic speech process What are the compelling reasons for carrying out dynamic speech modeling We provide the answer in two related aspects First scientific inquiry into the human speech code has been relentlessly pursued for several decades As an essential carrier of human intelligence and knowledge speech is the most natural form of human communication Embedded in the speech code are linguistic as well as para linguistic messages which are conveyed through four levels of the

speech chain Underlying the robust encoding and transmission of the linguistic messages are the speech dynamics at all the four levels Mathematical modeling of speech dynamics provides an effective tool in the scientific methods of studying the speech chain Such scientific studies help understand why humans speak as they do and how humans exploit redundancy and variability by way of multitiered dynamic processes to enhance the efficiency and effectiveness of human speech communication Second advancement of human language technology especially that in automatic recognition of natural style human speech is also expected to benefit from comprehensive computational modeling of speech dynamics The limitations of current speech recognition technology are serious and are well known A commonly acknowledged and frequently discussed weakness of the statistical model underlying current speech recognition technology is the lack of adequate dynamic modeling schemes to provide correlation structure across the temporal speech observation sequence Unfortunately due to a variety of reasons the majority of current research activities in this area favor only incremental modifications and improvements to the existing HMM based state of the art For example while the dynamic and correlation modeling is known to be an important topic most of the systems nevertheless employ only an ultra weak form of speech dynamics e g differential or delta parameters Strong form dynamic speech modeling which is the focus of this monograph may serve as an ultimate solution to this problem After the introduction chapter the main body of this monograph consists of four chapters They cover various aspects of theory algorithms and applications of dynamic speech models and provide a comprehensive survey of the research work in this area spanning over past 20 years This monograph is intended as advanced materials of speech and signal processing for graduate level teaching for professionals and engineering practitioners as well as for seasoned researchers and engineers specialized in speech processing
