## **Boolean Function Complexity:**

Boolean Function Complexity Michael S. Paterson, 1992-11-05 By considering the size of the logical network needed to perform a given computational task the intrinsic difficulty of that task can be examined Boolean function complexity the combinatorial study of such networks is a subject that started back in the 1950s and has today become one of the most challenging and vigorous areas of theoretical computer science The papers in this book stem from the London Mathematical Society Symposium on Boolean Function Complexity held at Durham University in July 1990 The range of topics covered will be of interest to the newcomer to the field as well as the expert and overall the papers are representative of the research presented at the Symposium Anyone with an interest in Boolean Function complexity will find that this book is a necessary purchase

*Boolean Function Complexity* Stasys Jukna, 2012-01-06 Boolean circuit complexity is the combinatorics of computer science and involves many intriguing problems that are easy to state and explain even for the layman This book is a comprehensive description of basic lower bound arguments covering many of the gems of this complexity Waterloo that have been discovered over the past several decades right up to results from the last year or two Many open problems marked as Research Problems are mentioned along the way The problems are mainly of combinatorial flavor but their solutions could have great consequences in circuit complexity and computer science The book will be of interest to graduate students and researchers in the fields of computer science and discrete mathematics

*The Complexity of Boolean Functions* Ingo Wegener, 1987 Presents a large number of recent research results previously unavailable in book form Initially deals with the well known computation models and goes on to special types of circuits parallel computers and branching programs Includes basic theory as well recent research findings Each chapter includes exercises

Lower Bounds for the Complexity of Restrictions of Boolean Functions A.V. Chashkin, 2018 The complexity of restrictions of Boolean functions is studied in various computational models Lower bounds for the complexity of the most complicated restrictions to domains of fixed size are established The complexity bounds are shown to be tight up to a constant multiplicative factor in the case of logic circuits For every Boolean function of variables whose circuit size is greater than where is an arbitrary positive constant it is proved that there exists a domain in  $\{0, 1\}^n$  the restriction to which has a nonlinear circuit size that differs by a constant factor from the circuit size of the most complicated partial Boolean function defined on this domain Any Boolean function of variables is proved to be uniquely determined by its values in no more than domains whose sizes are bounded from above by the product of the function complexity and  $n$

*An Introduction to Boolean Function Complexity* Michael S. Paterson, 1976 The complexity of a finite Boolean function may be defined with respect to its computation by networks of logical elements in a variety of ways The three complexities of circuit size formula size and depth are considered and some of the principal results concerning their relationships and estimations are presented with outlined proofs for some of the simpler theorems This survey is restricted to networks in which all two argument logical functions may be used

*Average Case Complexity for*

*Finite Boolean Functions* A.V. Chashkin, 2018 The average time of computing Boolean functions by straight line programs with a conditional stop is considered A straight line program consists of operators of two types Every operator of the first type computes a binary Boolean function whose arguments are either the values computed by preceding operators or the values of the input variables Every operator of the second type either terminates program execution or commands that the next operator is executed A measure of the complexity of such programs is the average execution time over all tuples of the input variables The complexity of computing almost all complete Boolean functions and almost all partial Boolean functions by such programs is proved to coincide up to a multiplicative constant with conventional circuit complexity Moreover these complexities are proved to differ up to a multiplicative constant by a factor of for almost all place Boolean functions equal to 1 on tuples The existence of Boolean functions of variables is proved for which the average execution time is less up to a multiplicative constant by a factor of 2 than the time required to compute them by conventional straight line programs

### **Complexity Measures of Boolean**

**Functions and Their Applications** Siddhesh Prashant Chaubal, 2020 The central focus of computational complexity theory is to measure the hardness of computing different functions Towards this end several measures of complexity for Boolean functions have been studied over the past few decades Examples of important complexity measures include sensitivity block sensitivity certificate complexity decision tree complexity and degree Studying the relationships between these different measures has been an active area of research In the first part of this dissertation we prove several results towards tightening the relationships between some of these measures particularly the sensitivity and block sensitivity Specifically we prove better cubic and sometimes quadratic upper bounds on block sensitivity in terms of sensitivity for certain classes of transitive functions We also prove tight lower bounds on the block sensitivity for the classes we consider In the other direction we give various new constructions of families of Boolean functions that exhibit quadratic separation between sensitivity and block sensitivity Our constructions have several novel aspects For example we give the first direct constructions of families of Boolean functions that have both 0 block sensitivity and 1 block sensitivity quadratically larger than sensitivity In the next part of this dissertation we introduce a new complexity measure of Boolean functions we call diameter that captures the relationship between certificate complexity and several other measures of Boolean functions We argue that estimating diameter may help to get improved bounds on certificate complexity in terms of sensitivity and other measures Further we prove tight bounds on the sensitivity and block sensitivity of transitive functions with constant diameter We also prove some implications for the log rank conjecture in communication complexity for XOR functions with bounded diameter In the last part of this dissertation we study applications of the relationship between some of these measures to machine learning Specifically we contribute towards two problems concerning decision trees as a machine learning model First we focus on the problem of modifying a given decision tree classifier to optimize a specific evaluation measure the recall of the classifier

under some constraints Finally we present some algorithms for decision trees for regression problems in the context of transfer learning *Foundations of Software Technology and Theoretical Computer Science V*. **Discrete Local Central Limit Theorems and Boolean Function Complexity Measures** Justin Gilmer,2015 This thesis consists of 6 chapters the first being an introduction Two chapters relate to local central limit theorems and three chapters relate to various boolean function complexity measures Although the problems studied in this work originate from different areas of mathematics the methods used to attack these problems are unified in their probabilistic and combinatorial nature In Chapter 2 we prove a local central limit theorem for the number of triangles in the Erdos Renyi random graph  $G_{n,p}$  for constant edge probability  $p$

In Chapter 6 we apply an existing local limit theorem for sums of independent random variables to estimate the density of a certain set of integers called happy numbers In Chapters 3 4 and 5 we will investigate the general question of how large one complexity measure of boolean functions can be relative to another In one case we present a probabilistic construction of family of boolean functions which show tight in the sense that there is a matching upper bound separation between two measures namely block sensitivity and certificate complexity We also give partial results for upper bounding one measure in terms of another This includes a new approach to the well known sensitivity conjecture which asserts that the degree of any boolean function is bounded above by some fixed power of its sensitivity **Cybernetics Abstracts** ,1967 Applied Algebra, Algebraic Algorithms, and Error-correcting Codes ,1988
