Disconnected Operation In A Distributed File System:

Disconnected Operation in a Distributed File System James J. Kistler, 1995-12-13 This book is based on the author's PhD thesis which was selected during the 1993 ACM Doctoral Dissertation Competition as one of the three best submissions The focus of this work is on the issue of availability in distributed file systems It presents the important new technique called disconnected operation in which clients mask failures and voluntary network detachments by emulating the functionality of servers where actual server oriented solutions are inadequate This permits client operation even under complete isolation from the server the clean integration of mobile computers into the system is an important side effect of the new technique The design and implementation of disconnected file service in a working system the Coda file system is described in detail

Helal, Abdelsalam A. Heddaya, Bharat B. Bhargava, 1996-08-31 *Replication Techniques in Distributed Systems* organizes and surveys the spectrum of replication protocols and systems that achieve high availability by replicating entities in failure prone distributed computing environments The entities discussed in this book vary from passive untyped data objects to typed and complex objects to processes and messages *Replication Techniques in Distributed Systems* contains definitions and introductory material suitable for a beginner theoretical foundations and algorithms an annotated bibliography of commercial and experimental prototype systems as well as short guides to recommended further readings in specialized subtopics This book can be used as recommended or required reading in graduate courses in academia as well as a handbook for designers and implementors of systems that must deal with replication issues in distributed systems **Design of a High Performance, High Availability, Distributed File System** Chetan Ahuja, 2001 **The Design and Implementation of a Distributed File System Based on Shared Network Storage** Steven R. Soltis, 1997 Exploiting Weak Connectivity in a Distributed File System Carnegie Mellon University. Computer Science Department, Lily B. Mummert, 1996 Abstract Weak connectivity in the form of intermittent low bandwidth or expensive networks is a fact of life in mobile computing For the foreseeable future access to cheap high performance reliable networks or strong connectivity will be limited to a few oases such as work or home in a vast desert of weak connectivity The design of distributed file systems has traditionally been based on an

assumption of strong connectivity Yet to provide ubiquitous data access it is vital that distributed file systems make effective use of weak connectivity This dissertation describes the design implementation and evaluation of weakly connected operation in the Coda File System The starting point of this work is disconnected operation in which a file system client operates using data in its cache during server or network failures Disconnected clients suffer from many limitations updates are not visible to other clients cache misses may impede progress updates are at risk from client loss or damage and the danger of update conflicts increases as disconnections are prolonged Weak connectivity provides an opportunity to alleviate these limitations Coda s strategy for weakly connected operation is best characterized as application transparent adaptation The system bears full responsibility for coping with the demands of weak connectivity This approach preserves upward compatibility by allowing applications to run unchanged Coda provides several mechanisms for weakly connected operation motivated by actual experience The foundation of adaptivity in this system is the communications layer which derives and supplies information on network conditions to higher system layers The rapid cache validation mechanism enables the system to recover quickly in intermittent environments The trickle reintegration mechanism insulates the user from poor network performance by propagating updates to servers asynchronously The cache miss handling mechanism alerts the user to potentially lengthy service times and provides opportunities for intervention A quantitative evaluation of these mechanisms based on controlled experimentation and empirical data gathered from the deployed system in everyday use shows that Coda is able to provide good performance even when network bandwidth varies over four orders of magnitude from modem speeds to Lan speeds
