*Distributed Real-Time Systems* Jeffrey J. P. Tsai, 1996-08-10 Distributed real time systems DRTSs are used in a wide range of applications including command and control systems flight control systems robotics patient monitoring systems and many others This volume provides an overview of various systematic approaches to the testing and debugging of DRTSs tasks that typically consume 50% to 70% of a new system s development costs Distributed Real Time Systems covers both the theoretical and practical issues involved in monitoring visualization and analysis methodology for verifying and debugging DRTSs It describes in detail how to overcome timing verification difficulties and improve system performance and reliability Complete with many carefully worked out examples as well as dozens of illustrations this timely and accessible work Explains real world debugging approaches proposed or tested using static analysis or dynamic analysis with or without monitoring Features step by step instructions for design implementation in hardware and software detecting timing errors and their causes graphical debugging methods and more Covers numerous analytical techniques including timed Petri nets temporal logic timed state transition systems timed process algebra and synchronous programming languages Makes distributed systems analysis accessible through examples such as a distributed telephone switching system and a fault tolerant distributed system Reviews many relevant professional papers and current research work The joint product of four leaders in the field Distributed Real Time Systems is an important text and reference for electrical and software engineers graduate students and anyone involved in computer and data processing technology

Cheng, 2003-03-13 Test und Validierung spielen bei Echtzeitsystemen eine zentrale Rolle Auf die Spezifikationen die der Hersteller angibt muss sich der Kunde hier in besonders hohem Ma e verlassen k nnen Bisher sind zu diesem Thema nur Artikelsammlungen erschienen Jetzt liegt endlich ein Buch vor das sich f r Fachleute und Studenten gleicherma en eignet und dem Leser einen umfassenden berblick ber die verschiedenen existierenden Ans tze verschafft Vor und Nachteile jedes Verfahrens werden ausf hrlich beschrieben das erleichtert die Methodenwahl in der Praxis Der Autor ist nicht nur ein anerkannter Experte auf seinem Gebiet sondern genie t auch einen hervorragenden p dagogischen Ruf

**Monitoring and Debugging of Distributed Real-time Systems** Jeffrey J.-P. Tsai, Steve J. H. Yang, 1995 [Design Guidelines for a Monitoring Environment Concerning Distributed Real-time Systems](#) Aida Omerovic, 2004 While the dependability requirements of distributed real time systems are expanding there is currently no framework for defining and mapping these requirements into the system design and operation A method of controlling and achieving the dependability level is real time monitoring which measures the degree of requirements fulfilment relates it to the pre defined measurable system level expectations and dynamically adapts the system based on quality metrics risk analysis cost evaluation control theory neural networks data acquisition and system knowledge management The book deduces a framework to reveal define quantify measure analyse design implement test monitor and enhance dependability functional and non functional requirements of a

distributed system with real time constraints It is presented how the framework can be applied throughout all life cycle stages under varying constraints and with maximised cost effectiveness An overview of the tools and methodologies applicable has been given and an integrated and generalised architecture for ensuring continuous fulfilment of system requirements proposed The framework provides a multilevel specification mechanism to establish the preservation of system requirements This ensures the correct functioning of system through adaptations at run time Among the benefits are controlled access and coordinated resource sharing in accordance with service level agreement policies multi stakeholder interest preservation transparency with respect to location naming performance etc achievement of quality of service on demand decentralisation seamless integration of resources and applications as well as increased predictability

**READERSHIP** The intended audience is broad real time and distributed systems scientists and developers software engineers students quality assurance managers contractors users service providers and all those searching for an alternative approach to handling and ensuring automated control of fulfilment of system requirements Moreover those needing a handbook on contract negotiations and a method of tracing operational results back into system requirements of long lived projects with high dependability and integrity demands

**Compositional Verification of Concurrent and Real-Time Systems** Eric Y.T. Juan, Jeffrey J.P. Tsai, 2012-12-06 With the rapid growth of networking and high computing power the demand for large scale and complex software systems has increased dramatically Many of the software systems support or supplant human control of safety critical systems such as flight control systems space shuttle control systems aircraft avionics control systems robotics patient monitoring systems nuclear power plant control systems and so on Failure of safety critical systems could result in great disasters and loss of human life Therefore software used for safety critical systems should preserve high assurance properties In order to comply with high assurance properties a safety critical system often shares resources between multiple concurrently active computing agents and must meet rigid real time constraints However concurrency and timing constraints make the development of a safety critical system much more error prone and arduous The correctness of software systems nowadays depends mainly on the work of testing and debugging Testing and debugging involve the process of detecting locating analyzing isolating and correcting suspected faults using the runtime information of a system However testing and debugging are not sufficient to prove the correctness of a safety critical system In contrast static analysis is supported by formalisms to specify the system precisely Formal verification methods are then applied to prove the logical correctness of the system with respect to the specification Formal verification gives us greater confidence that safety critical systems meet the desired assurance properties in order to avoid disastrous consequences

Real Time computing is one of the most demanding and challenging areas in computing. It is also of great importance since real time software is indispensable to all ultra reliable and safety critical applications. The objective of this book is to provide an introduction to the whole area of real time computing. Although its boundaries are bit well defined the body of knowledge relevant to the study of real time systems encompasses a whole range of topics. There are issues such as clocks specification design and modelling of real time systems which are exclusive to the study of real time systems. There are also a number of fairly independent topics having applications outside real time systems but with a definite real time dimension. The book supplies a framework for the study of real time systems facilitating a higher level of abstraction and a sharper focus on concepts and issues. Invariably this framework relies on mathematics but the mathematics are explained and kept to the minimum. Most chapters are self contained and each deals with a separate topic. The exceptions are Chapters 2 & 4 since they contain notations and concepts used elsewhere. The occasional cross reference between chapters are intended to underline the coherence of the material rather than the dependence of topics.

After a long period in which the research focused mainly on industrial robotics nowadays scientists aim to build machines able to act autonomously in unstructured domains and to interface friendly with humans while performing intelligently their assigned tasks. Such intelligent autonomous systems are now being intensively developed and are ready to be applied to every field from social life to modern enterprises. We believe the following years will be increasingly characterised by their extensive use. This is dramatically changing the whole scenario of human society.

In 1999 the IFAC IFIP Workshop on Real Time Programming (WRTP) joined forces with the Workshop on Active and Real Time Database Systems (ARTDB). Both series of workshops provide an excellent forum for exchanging information on recent scientific and technological advances and practices in real time computing, a field that is becoming an essential enabling discipline of both control engineering and computer science and engineering. The annual Workshop on Real Time Programming and the bi annual Workshop on Active and Real Time Databases Systems are intended as meetings of relatively small numbers of experts in their fields taking place as truly international events. The 1999 Workshop maintained the outstanding quality of both series providing an opportunity to assess

the state of the art to present new results and to discuss possible lines of future developments. Primarily it focused on software development for real time systems, real time operating systems and active and real time database systems. In particular the technical programme of the Workshop covered latest research and developments in requirements engineering, software engineering, active and real time database systems, communication and clock synchronisation, embedded systems, formal methods, operating systems and scheduling. Out of 58 submissions from 19 countries the International Programme Committee selected 26 regular papers and 8 reserve papers for presentation at the Workshop. Contributions come from Europe, North America, Australia and the Far East. In addition to these the programme also featured two world renowned keynote speakers and a discussion panel about the state of the art in the field of active real time database systems.

Proceedings, Seventh International Software Metrics Symposium, 2001. Thirty papers presented at an April 2001 symposium report on measurement, empirical studies and other quantitative and qualitative methods applied to software development, management and quality assurance. Some of the topics are a software cost estimation model based on categorical data, the influence of team size and defect detection technique on inspection effectiveness, information theory based measures of coupling and cohesion of a module and usage measurement for statistical web testing and reliability analysis. Other topics include evaluating software degradation through entropy, a feedback approach to validation of a GQM study, the impact of design properties on development cost in object oriented systems and using simulation to evaluate prediction techniques. In today's highly competitive environment the transputer market provides Europe with a great number of important assets. From the first transputer with its four links and OCCAM language which opened the door to a whole series of distributed memory machines to the T9000 with the C104 and the standardization of software programs, progress in this field has come a long way. **American Book Publishing Record**, 1996.
