Structured computer organization Andrew S. Tanenbaum, 1976 **The Second Age of Computer Science** Subrata Dasgupta, 2018-05-01 By the end of the 1960s a new discipline named computer science had come into being A new scientific paradigm the computational paradigm was in place suggesting that computer science had reached a certain level of maturity Yet as a science it was still precociously young New forces some technological some socio economic some cognitive impinged upon it the outcome of which was that new kinds of computational problems arose over the next two decades Indeed by the beginning of the 1990 s the structure of the computational paradigm looked markedly different in many important respects from how it was at the end of the 1960s Author Subrata Dasgupta named the two decades from 1970 to 1990 as the second age of computer science to distinguish it from the preceding genesis of the science and the age of the Internet World Wide Web that followed This book describes the evolution of computer science in this second age in the form of seven overlapping intermingling parallel histories that unfold concurrently in the course of the two decades Certain themes characteristic of this second age thread through this narrative the desire for a genuine science of computing the realization that computing is as much a human experience as it is a technological one the search for a unified theory of intelligence spanning machines and mind the desire to liberate the computational mind from the shackles of sequentiality and most ambitiously a quest to subvert the very core of the computational paradigm itself We see how the computer scientists of the second age address these desires and challenges in what manner they succeed or fail and how along the way the shape of computational paradigm was altered And to complete this history the author asks and seeks to answer the question of how computer science shows evidence of progress over the course of its second age

Architectural Intelligence Molly Wright Steenson, 2017-12-22 Architects who engaged with cybernetics artificial intelligence and other technologies poured the foundation for digital interactivity In Architectural

Intelligence Molly Wright Steenson explores the work of four architects in the 1960s and 1970s who incorporated elements of interactivity into their work Christopher Alexander Richard Saul Wurman Cedric Price and Nicholas Negroponte and the MIT Architecture Machine Group all incorporated technologies including cybernetics and artificial intelligence into their work and influenced digital design practices from the late 1980s to the present day Alexander long before his famous 1977 book *A Pattern Language* used computation and structure to visualize design problems Wurman popularized the notion of information architecture Price designed some of the first intelligent buildings and Negroponte experimented with the ways people experience artificial intelligence even at architectural scale Steenson investigates how these architects pushed the boundaries of architecture and how their technological experiments pushed the boundaries of technology What did computational cybernetic and artificial intelligence researchers have to gain by engaging with architects and architectural problems And what was this new space that emerged within these collaborations At times Steenson writes the architects in this book characterized themselves as anti architects and their work as anti architecture The projects Steenson examines mostly did not result in constructed buildings but rather in design processes and tools computer programs interfaces digital environments Alexander Wurman Price and Negroponte laid the foundation for many of our contemporary interactive practices from information architecture to interaction design from machine learning to smart cities

Bench-Capon,1993 The practical take up of Knowledge Based Systems KBSs is usually described as disappointing One
explanation of the reluctance of organisations to make a real commitment to these systems stems from the lack of well
defined techniques to engineer them in an acceptable manner Without the assurance of quality that can be given by the use
of a proven methodology the risk of investing substantially in these systems will remain a risk too great to be taken One of
the chief manifestations of the lack of these techniques is that it is impossible to say with any assurance that it will be
possible to maintain the systems so that their useful life can be extended This book is concerned with the maintenance of
KBSs providing a balance between the academic and the practical and containing analysis of tools developed in a research
project The intention of the book is to move from very general concerns available to all systems through to specific
techniques and tools designed to address particular problems in particular representations before concluding with some
more general remarks This book is essential reading for anyone whether in a commercial or academic environment who
wishes to build a serious Knowledge Based System that will continue to be used over a period of time **SPECIAL FEATURES**
Building a Knowledge Based System is not the end of the story the system must be used and during its period of use
the knowledge on which it relies will change and develop A Knowledge Based System that is not to become rapidly obsolete
must change and develop with it This book addresses this neglected area of maintenance emphasising the specific
maintenance tasks required by a Knowledge Based System The book provides a balance between the academic and the
