**Computer Models in Environmental Planning** Steven I. Gordon, 2012-12-06 The purpose behind Computer Models in Environmental Planning is to provide a practical and applied guide to the use of these models in environmental planning and environmental impact analysis Models concerning water quality air quality stormwater runoff land capability evaluation land information systems and hazardous waste disposal are reviewed and critiqued I have tried to emphasize the practical problems with data computer capabilities and other analytical questions that must be faced by the practitioner attempting to use these models Thus I do not delve too deeply into the theoretical underpinnings of the models referring the reader instead to specialized references in this area For each environmental area I review the major models and methods comparing their assumptions ease of use and other characteristics Practical examples illustrate the benefits and problems of using each model Computer models are increasingly being used by planning and engineering professionals for locating and planning public works and industrial commercial and residential projects while evaluating their environmental impacts The requirements of the National Environmental Policy Act and related state laws as well as separate state and federal laws concerning air and water quality stormwater runoff land use and hazardous waste disposal have made the use of these methods mandatory in many circumstances Yet explanations of both the benefits and problems associated with supposedly easy to use computer versions of these models and methods remain at best difficult to retrieve and at worst incomplete

*Computer Generated Physical Properties* Stan Bumble, 1999-06-01 Computer Generated Physical Properties offers the environmental scientist a basis to predict the properties of molecules and reengineer them to remove those properties that are harmful to the environment This technology is currently used in other fields and is now becoming popular in the environmental engineering field because of its pollution prevention and waste reduction capabilities This book interdisciplinary in scope treats the physical properties of matter as generated by computers It covers a wide variety of topics pointing towards synthesizing new molecules to substitute for reactants intermediaries and products in industrial processes with better physical and environmental properties than the original The author achieves this with a spreadsheet program called SYNPROPS that operates on a PC computer with optimization features A radar type graph one for each property visually sorts the various groups in order of their contribution to the property creating the necessity for a computer to obtain answers for the structure of the optimum molecules for substitution or synthesis The author discusses applications to biologically active molecules without side effects including antineoplastic drugs Additionally he demonstrates model compounds and the applications of SYNPROPS optimization and substitution This book has everything you need to know about deriving properties and combinational chemistry from molecular structure

**Management of Low-Grade Fuels** Mary MacDonald, Michael Chadwick, Gareg Aslanian, 2013-11-05 The negative environmental impacts of energy use particularly soil and water pollution continue to present serious policy dilemmas The release of emissions and effluents and the build up of solid waste throughout the fuel cycle have disruptive effects on natural habitats and human health Further fuel combustion can result in the emission of carbon dioxide ozone methane and nitrogen dioxide the greenhouse gases which have been linked to climate change The safe and sustainable use of energy has become an important issue in the wider environmental debate In this report researchers from the Stockholm Environment Institute explore the issues raised by the use of low grade fuels such as peat wood biomass lignite oil shale and municipal and industrial wastes The present strategies and policy options for all stages of the process from mining and transport to processing and combustion With those who would like to learn more about these fuels in mind the material is presented clearly and discussions of environmental protection measures are given in table form throughout the ease of reference A directory of environmental guidelines regulations and standards is given in an appendix While a high calorific value fuels remain the most significant source of energy in many countries economic and other constraints on the use of these fuels may result in more nations turning to low grade sources of energy to operate their industrial or transportation sectors The greater potential for environmental degradation that accompanies the use of low grade fuels means that it is crucial that environmentally sound methods for their management such as those presented here be more widely available The Environmental Management of Low Grade Fuels will be valuable for industry specialists policy makers students and all who are concerned with the life cycle of these materials Mary MacDonald is an affiliated scientist and Michael Chadwick is a former director at the Stockholm Environment Institute Garegin Aslanian is a senior associate with the Institute for High Temperature Research in Moscow Originally published in 1996

**Operations Research and Environmental Management** Carlo Carraro, Alain Haurie, 2012-12-06 The activities of the Fondazione ENI Enrico Mattei cover a broad spectrum of research topics ranging from economics to engineering from environmental management at the industry or regional level to basic mathematical modelling research It is the combination of the activities on these last two topics that led the Fondazione to organise with the University of Geneva a workshop where operation research tools were designed with the aim to provide national and local policy makers with appropriate analytical and policy instruments for environmental management In the recent past attention has often been devoted to global environmental issues in which the level of policy making is either international through multi country agreements on emission control or national when environmental policies are designed to control domestic pollution Many environmental problems however have a local or regional dimension Even when their dimension is global e g in the case of the greenhouse gas effect relevant decisions on emission control such as the adoption of energy saving utilities are taken at the local level In many countries the current legislation imposes the local authorities to prepare plans and adopt measures to control energy consumption or to reduce waste of

natural resources It is therefore important to analyze the way in which local or regional authorities optimise their environmental management
