Biomass Spectrum:

The Biomass Spectrum S. R. Kerr, L. M. Dickie, 2001-08-29 Kerr and Dickie propose the development of a new ecological theory one that can lead to a more effective remedy for the drastic effects of heavy fishing on natural communities of organisms in both marine and freshwater environments By plotting the densities of the biomass of all organisms in a given community by body size classes the authors provide empirical evidence of what they term the biomass body size spectrum in the world's oceans After examining this evidence they propose an underlying theory of predator-prey energy transfer larger species eat smaller species providing energy exchange across all species within an ecosystem Providing the first comprehensive synthesis of the energy flow within the biomass spectrum this book demonstrates not only a new understanding of the self-organizing properties of ecological production systems but also the potential of the biomass spectrum methodology for offering practical remedies when these natural systems are exploited by humans *The Biomass Spectrum* S. R. Kerr, Lloyd Merlin Dickie, 2001 Kerr and Dickie propose the development of a new ecological theory one that can lead to a more effective remedy for the drastic effects of heavy fishing on natural communities of organisms in both marine and freshwater environments By plotting the densities of the biomass of all organisms in a given community by body size classes the authors provide empirical evidence of what they term the biomass body size spectrum in the world's oceans After examining this evidence they propose an underlying theory of predator-prey energy transfer larger species eat smaller species providing energy exchange across all species within an ecosystem Providing the first comprehensive synthesis of the energy flow within the biomass spectrum this book demonstrates not only a new understanding of the self-organizing properties of ecological production systems but also the potential of the biomass spectrum methodology for offering practical remedies when these natural systems are exploited by humans W Gary Sprules Food Webs: From Connectivity to Energetics, 2005-05-16 The most recent volume of this series *Advances in Ecological Research* demonstrates a captivating knowledge of recent advances in the analysis of food webs A food web describes the network of predator-prey interactions within a community The simplest description of a food web specifies only who eats whom a connectance web with no indication of how much or how often Chapters in this book begin with a discussion of the most detailed connectance webs ever compiled and advance to incorporate information on the body size and numerical abundance of the species The results yield new ways of describing food webs and powerful new models for estimating patterns of energy flow in ecosystems Provides fresh ways of describing food webs and applies previous observations in a new context Ranked as the 1 publication in the Institute for Scientific Information in the Ecology section of 2000 Powerful new theory AND application to some of the best food web data in the world Many mathematical models for food web structure and function Integrates previously unconnected perspectives on the description of ecological communities *Fish Ecology, Evolution, and Exploitation* Ken H. Andersen, 2019-07-16 Fish are one of the most important global food sources supplying a significant share of the world's

protein consumption From stocks of wild Alaskan salmon and North Sea cod to entire fish communities with myriad species fisheries require careful management to ensure that stocks remain productive and mathematical models are essential tools for doing so Fish Ecology Evolution and Exploitation is an authoritative introduction to the modern size and trait based approach to fish populations and communities Ken Andersen covers the theoretical foundations mathematical formulations and real world applications of this powerful new modeling method which is grounded in the latest ecological theory and population biology He begins with fundamental assumptions on the level of individuals and goes on to cover population demography and fisheries impact assessments He shows how size and trait based models shed new light on familiar fisheries concepts such as maximum sustainable yield and fisheries selectivity insights that classic age based theory can't provide and develops novel evolutionary impacts of fishing Andersen extends the theory to entire fish communities and uses it to support the ecosystem approach to fisheries management and forges critical links between trait based methods and evolutionary ecology Accessible to ecologists with a basic quantitative background this incisive book unifies the thinking in ecology and fisheries science and is an indispensable reference for anyone seeking to apply size and trait based models to fish demography fisheries impact assessments and fish evolutionary ecology *Ecology* C. Lévêque, 2003-01-10 Eleven plants were chosen so as to cover a wide range of biological characteristics perennial annual autogamous allogamous etc in this study Three chapters on methodology complement these studies The first is devoted to the use of biological and molecular markers to analyse the diversity of collections the second addresses data analysis and the third describes a method for constituting core collections based on maximization of variability Deep-Sea Food Chains and the Global Carbon Cycle G.T. Rowe, Vita Pariente, 2012-12-06 Carbon dioxide and other greenhouse gases are increasing in the atmosphere due to the burning of fossil fuels the destruction of rain forests etc leading to predictions of a gradual global warming which will perturb the global biosphere An important process which counters this trend toward potential climate change is the removal of carbon dioxide from the surface ocean by photosynthesis This process packages carbon in phytoplankton which enter the food chain or sink into the deep sea Their ultimate fate is a rain of organic debris out of the surface mixed layer of the ocean On a global scale the mechanisms and overall rate of this process are poorly known The authors of the 25 papers in this volume present their state of the art approaches to quantifying the mechanisms by which the rain of biogenic debris nourishes deep ocean life Prominent deep sea ecologists geochemists and modelers address relationships between data and models of carbon fluxes and food chains in the deep ocean An attempt is made to estimate the fate of carbon in the deep sea on a global scale by summing up the utilization of organic matter among all the populations of the abyssal biosphere Comparisons are made between these ecological approaches and estimates of geochemical fluxes based on sediment trapping one dimensional geochemical models and horizontal physical input from continental margins Planning interdisciplinary enterprises between geochemists and ecologists including new field programs are summarized in the final

chapter The summary includes a list of the important gaps in understanding which must be addressed before the role of the deep sea biota in global scale processes can be put in perspective **Marine Ecosystem Dynamics Models:**

Construction, Application And Development Honghua Shi, Chengcheng Shen, Yongzhi Liu, 2023-09-13 This book presents the fundamental theories methodologies and case studies of marine ecosystem modeling with a special focus on marine ecological dynamics that could provide scientists and researchers with a stable and reliable technical framework to study marine life and their developments This book also clarifies the research objective and model classification methods of marine ecosystem dynamics research and analyzes the key marine ecological processes that affect modeling The technical framework for improving the performance of modeling is also proposed and the latest progress in research as well as existing difficulties and challenges in end to end dynamics models are reviewed and analyzed A dimensionality reduction theorem is established and derived for analyzing the stability of the solutions of a class of self conserving marine ecosystem dynamic models Also included in this work are several new types of marine ecosystem dynamics models constructed by modern computing methods including artificial neural networks cellular automata and statistical dynamics and case studies This book is a suitable reference for professional and technical personnel managers and graduate students specializing in the evolution mechanism simulation predication and regulation of marine ecosystems Canadian Journal of Fisheries and Aquatic Sciences, 2003 **Philosophical Transactions**, 1994 Each issue of Transactions B is devoted to a specific area of the biological sciences including clinical science All papers are peer reviewed and edited to the highest standards Published on the 29th of each month Transactions B is essential reading for all biologists *ICES Cooperative Research Report*, 2005 **Atlantic Meridional Transect** Patrick M.
