Adventures in UNIX Network Applications Programming Bill Rieken, Lyle Weiman, 1992-11-04 Written to help you with the ten percent of the network programming that consumes ninety percent of your time and causes most of your vexing problems it teaches communications network programming including interprocess communicator protocols and process level application programming Geared to the growing number of programmers in the UNIX workstation environment it covers a variety of the most widely used protocols of OSI TCP IP X 25 Berkeley Sockets AT T System V Streams and more In addition it develops the code for solutions to typical problems in network software programming and offers numerous practical and helpful examples

**Interprocess Communications in Linux** John Shapley Gray, 2003 Gray zeroes right in on the key techniques of processes and interprocess communication from primitive communications to the complexities of sockets The book covers every aspect of UNIX Linux interprocess communications in sufficient detail to allow experienced programmers to begin writing useful code immediately

**Visualization Methods in High Performance Computing and Flow Simulation** W. Borchers, 1996-12 The developments of new algorithms in applied mathematics of new concepts in computer sciences and of new hardware in computer technology have led to an immense output of data streams describing the solutions of important physical or technological problems In order to understand and to explore the results of calculations new visualization methods have been developed These novel methods are indispensable for mathematicians and engineers working with problems such as flow theory or elasticity These proceedings contain selected contributions from the DFG workshop on visualization held at the University of Paderborn January 18 20 1994 and will be of interest to researchers in the above mentioned fields

Software Maintenance - A Management Perspective Phaneendra Nath Vellanky, 2007-10-23 Computer systems play an important role in our society Software drives those systems Massive investments of time and resources are made in developing and implementing these systems Maintenance is inevitable It is hard and costly Considerable resources are required to keep the systems active and dependable We cannot maintain software unless maintainability characters are built into the products and processes There is an urgent need to reinforce software development practices based on quality and reliability principles Though maintenance is a mini development lifecycle it has its own problems Maintenance issues need corresponding tools and techniques to address them Software professionals are key players in maintenance While development is an art and science maintenance is a craft We need to develop maintenance personnel to master this craft Technology impact is very high in systems world today We can no longer conduct business in the way we did before That calls for reengineering systems and software Even reengineered software needs maintenance soon after its implementation We have to take business knowledge procedures and data into the newly reengineered world Software maintenance people can play an important role in this migration process Software technology is moving into global and distributed networking environments Client server systems and object orientation are on their way Massively parallel

processing systems and networking resources are changing database services into corporate data warehouses Software engineering environments rapid application development tools are changing the way we used to develop and maintain software Software maintenance is moving from code maintenance to design maintenance even onto specification maintenance Modifications today are made at specification level regenerating the software components testing and integrating them with the system Eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems Software professionals have to maintain not only the software but the momentum of change in systems and software In this study we observe various issues tools and techniques and the emerging trends in software technology with particular reference to maintenance We are not searching for specific solutions We are identifying issues and finding ways to manage them live with them and control their negative impact
