Designs for Science Literacy American

Association for the Advancement of Science, 2001-03-22 The call for science curriculum reform has been made over and over again for much of the twentieth century Arguments have been made that the content of the curriculum is not appropriate for meeting the individual and social needs of people living in the modern world that the curriculum has become overstuffed with topics and does not serve students especially well and above all that the curriculum does not generate the student learning it is expected to produce The latest volume in a continuing series of publications from the AAAS designed to reform science education Designs for Science Literacy presupposes that curriculum reform must be considerably more extensive and fundamental than the tinkering with individual courses and subjects that has been going on for decades Designs deals with the critical issues involved in assembling sound instructional materials into a new coherent K 12 whole The book pays special attention to the need to link science oriented studies to the arts and humanities and also proposes how to align the curriculum with an established set of learning goals while preserving the American tradition of local responsibility for the curriculum itself If fundamental curriculum reform is ever to occur a new process for creating alternatives will have to be developed Designs for Science Literacy provides the groundwork for such a process

Designing Instructional Systems A J Romiszowski, 2016-01-08
This book deals with large scale or macro level instructional design which is referred to by other authors variously as curriculum development course design training system design or instructional systems design. The emphasis throughout the book is on the application of a systems approach which implies both a way of thinking about the problem and a methodology for seeking and developing solutions. Thus the approach of the book is problem oriented. The successful problem solver requires more than a technique or procedure. He requires experience of similar problems, some general principles that he can apply to the class of problems and a great deal of creativity to develop an optimal method of solving each problem. This book brings together the theories and practical experience that have been built up by instructional technologists over the last two decades, the techniques that are currently most used for the analysis of problems in education and for their solution and a range of new ideas specially developed by the author to encourage the creative element so often missing from educational materials. This book is intended for anyone involved in instructional design. It is designed on a grid structure to facilitate the reader's choice of chapters. Those who wish to gain a general overview may concentrate on the chapters at the theory base and analysis levels. Those more practically concerned with course design will find much of use in the synthesis and evaluation levels. Those who wish simply to discover what's new in this book and its treatment of instructional design will find what they are seeking principally in the analysis and evaluation levels.

Rethinking Engineering Education Edward Crawley, Johan Malmqvist, Soren Ostlund, Doris Brodeur, 2007-08-24
In the past ten years, leaders in engineering industries have identified specific knowledge, skills, and attitudes required of their workforce if they want to be innovative and competitive in a global marketplace. Engineering education programs have kept pace with emerging disciplinary knowledge, research, and technologies but have been less successful in ensuring that their graduates acquire the knowledge, skills, and attitudes desired by industry. Evaluation by accreditation agencies and professional associations in the United States, Canada, the United Kingdom, Sweden, Denmark, South Africa, and other countries are moving toward an outcomes-based approach. These groups have specified outcomes for graduating engineers among their evaluative criteria. Their lists of skills overlap with those generated by engineering industries. Our book describes an approach to engineering education that integrates a comprehensive set of personal and interpersonal skills and process, product, and system building skills with disciplinary knowledge. The education of engineers is set in the context of engineering practice that is: Conceiving, Designing, Implementing, and Operating CDIO through the entire lifecycle of engineering processes, products, and processes. The CDIO model and the topics in the book will be of increasing interest in the next five to ten years. At the start of the CDIO Initiative

four leading engineering programs in the United States and Sweden adopted the CDIO model and collaborated in its development and implementation. In less than six years the collaboration has grown to include more than twenty programs in nine different countries. This book will be both a description of the development and implementation of the CDIO model and a guide to engineering programs worldwide who seek to improve their programs.
