## **Current Options For Cereal Improvement:**

**Current Options for Cereal Improvement** M. Maluszynski, 1988-12-31 China was the first country to use cytoplasmic male sterility to develop hybrid rice for commercial use in 1973 In 1986 more than 8 million hectares of hybrid rice were planted in China which is one fourth of the total rice area and produces one third of the total rice in the country Hybrids usually out yield the leading commercial varieties by 20 30% giving an average yield advantage of 1 to 1.5 t/ha because of their better morphological traits higher physiological efficiency better resistance to major diseases and insects and wide adaptability to various agro ecological stresses

**IMPROVEMENT OF HYBRID RICE A Mutation techniques** Almost all of the cultivated F1 rice hybrids in China are developed from cytoplasmic male sterile and restorer lines According to surveys made in recent years more than 30 sources of cytoplasmic male sterility in rice can be identified among which only six are being commercially used Table 1 Wild rice with aborted pollen WA cytoplasmic male sterility system is the most popular one in use to develop male sterile lines MS line in China The main technique available for developing stable MS lines is substitution backcrossing of the genome of one species into alien cytoplasm of another Sufficient backcrosses are required to eliminate all nuclear genes derived from the cytoplasm donor species A number of studies have shown that using interspecies crosses such as the cross of wild rice *Oryza perennis* × *Oryza sativa* f

**Somaclonal Variation and Induced Mutations in Crop Improvement** S.M. Jain, D.S. Brar, B.S. Ahloowalia, 2013-03-14 Genetic variability is an important parameter for plant breeders in any conventional crop improvement programme Very often the desired variation is unavailable in the right combination or simply does not exist at all However plant breeders have successfully recombined the desired genes from cultivated crop germplasm and related wild species by sexual hybridization and have been able to develop new cultivars with desirable agronomic traits such as high yield disease pest and drought resistance So far conventional breeding methods have managed to feed the world's ever growing population Continued population growth no further scope of expanding arable land soil degradation environmental pollution and global warming are causes of concern to plant biologists and planners Plant breeders are under continuous pressure to improve and develop new cultivars for sustainable food production However it takes several years to develop a new cultivar Therefore they have to look for new technologies which could be combined with conventional methods to create more genetic variability and reduce the time in developing new cultivars with early maturity and improved yield The first report on induced mutation of a gene by H.J. Muller in 1927 was a major milestone in enhancing variation and also indicated the potential applications of mutagenesis in plant improvement Radiation sources such as X rays gamma rays and fast neutrons and chemical mutagens e.g. ethyl methane sulphonate have been widely used to induce mutations

**Use of Mutation Techniques for Improvement of Cereals in Latin America**, 1996 *Transgenic Plants and Crops* George C. Khachatourians, Y. H. Hui, Ralph Scorza, Wai-Kit Nip, 2002-03-26 With contributions from nearly 130 internationally renowned experts in the field this reference details advances in transgenic plant construction and explores the social political and legal

aspects of genetic plant manipulation It provides analyzes of the history genetics physiology and cultivation of over 30 species of transgenic seeds fruits and vegetables Stressing the impact of genetic engineering strategies on the nutritional and functional benefit of foods as well as on consumer health and the global market economy the book covers methods of gene marking transferring and tagging public perceptions to the selective breeding hybridization and recombinant DNA manipulation of food

**In Vitro Haploid Production in Higher Plants** S. Mohan Jain,S.K. Sopory,R.E. Veilleux,2013-03-09 Since the beginning of agricultural production there has been a continuous effort to grow more and better quality food to feed ever increasing populations Both improved cultural practices and improved crop plants have allowed us to divert more human resources to non agricultural activities while still increasing agricultural production Malthusian population predictions continue to alarm agricultural researchers especially plant breeders to seek new technologies that will continue to allow us to produce more and better food by fewer people on less land Both improvement of existing cultivars and development of new high yielding cultivars are common goals for breeders of all crops In vitro haploid production is among the new technologies that show great promise toward the goal of increasing crop yields by making similar germplasm available for many crops that was used to implement one of the greatest plant breeding success stories of this century i e the development of hybrid maize by crosses of inbred lines One of the main applications of anther culture has been to produce diploid homozygous pure lines in a single generation thus saving many generations of backcrossing to reach homozygosity by traditional means or in crops where self pollination is not possible Because doubled haploids are equivalent to inbred lines their value has been appreciated by plant breeders for decades The search for natural haploids and methods to induce them has been ongoing since the beginning of the 20th century

**Plant Breeding Reviews, Volume 15** Jules Janick,2010-04-22 Plant Breeding Reviews is an ongoing series presenting state of the art review articles on research in plant genetics especially the breeding of commercially important crops Articles perform the valuable function of collecting comparing and contrasting the primary journal literature in order to form an overview of the topic This detailed analysis bridges the gap between the specialized researcher and the broader community of plant scientists
