Artificial Intelligence in Perspective Daniel Gureasko Bobrow, 1993 *Artificial Intelligence Perspective for Smart Cities* Vahap Tecim, Sezer Bozkus Kahyaoglu, 2022-11-23 The concept of a smart city is used widely in general however it is hard to explain because of the complexity and multidimensionality of this notion However the essential qualification for being a smart city is to achieve sustainable social environmental and economic development and boost the living standards of society based on Information and Communication Technology ICT and Artificial intelligence AI AI in smart cities has become an important aspect for cities that face great challenges to make smart decisions for social well being particularly cybersecurity and corporate sustainability In this context we aim to contribute literature with a value added approach where various AI applications of smart cities are discussed from a different perspective First we start by discussing the conceptual design modeling and determination of components for the sustainability of a smart city structure Since smart cities operate on spatial based data it is important to design operate and manage smart city elements using Geographical Information Systems GIS technologies Second we define the structure type unit and functionality of the layers to be placed on the GIS to achieve best practices based on Industry 4 0 components Transportation is one of the key indicators of smart cities so it is critical to make transportation in smart cities accessible for different disabled groups by using AI technologies Third we demonstrate what kinds of technologies should be used for which disabled groups in different transportation vehicles with specific examples Finally we create a discussion platform for processes and sub processes such as waste management emergency management risk management and data management for establishing smart cities including the financial and ethical aspects

Luger, 2021-07-02 *Knowing our World An Artificial Intelligence Perspective* considers the methodologies of science computation and artificial intelligence to explore how we humans come to understand and operate in our world While humankind s history of articulating ideas and building machines that can replicate the activity of the human brain is impressive Professor Luger focuses on understanding the skills that enable these goals Based on insights afforded by the

challenges of AI design and program building *Knowing our World* proposes a foundation for the science of epistemology Taking an interdisciplinary perspective the book demonstrates that AI technology offers many representational structures and reasoning strategies that support clarification of these epistemic foundations This monograph is organized in three Parts the first three chapters introduce the reader to the foundations of computing and the philosophical background that supports the AI tradition These three chapters describe the origins of AI programming as iterative refinement and the representations and very high level language tools that support AI application building The book s second Part introduces three of the four paradigms that represent research and development in AI over the past seventy years the symbol based connectionist and complex adaptive systems Luger presents several introductory programs in each area and demonstrates their use The final three chapters present the primary theme of the book bringing together the rationalist empiricist and pragmatist philosophical traditions in the context of a Bayesian world view Luger describes Bayes theorem with a simple proof to demonstrate epistemic insights He describes research in model building and refinement and several philosophical issues that constrain the future growth of AI The book concludes with his proposal of the epistemic stance of an active pragmatic model revising realism

Machine Intelligence Andy Clark, Toribio, 2012-11-12 Summarizes and illuminates two decades of research Gathering important papers by both philosophers and scientists this collection illuminates the central themes that have arisen during the last two decades of work on the conceptual foundations of artificial intelligence and cognitive science Each volume begins with a comprehensive

introduction that places the coverage in a broader perspective and links it with material in the companion volumes The collection is of interest in many disciplines including computer science linguistics biology information science psychology neuroscience iconography and philosophy Examines initial efforts and the latest controversies The topics covered range from the bedrock assumptions of the computational approach to understanding the mind to the more recent debates concerning cognitive architectures all the way to the latest developments in robotics artificial life and dynamical systems theory The collection first examines the lineage of major research programs beginning with the basic idea of machine intelligence itself then focuses on specific aspects of thought and intelligence highlighting the much discussed issue of consciousness the equally important but less densely researched issue of emotional response and the more traditionally philosophical topic of language and meaning Provides a gamut of perspectives The editors have included several articles that challenge crucial elements of the familiar research program of cognitive science as well as important writings whose previous circulation has been limited Within each volume the papers are organized to reflect a variety of research programs and issues The substantive introductions that accompany each volume further organize the material and provide readers with a working sense of the issues and the connection between articles

Explainable Human-AI Interaction Sarath Sreedharan, Anagha Kulkarni, Subbarao Kambhampati, 2022-01-24 From its inception artificial intelligence AI has had a rather ambivalent relationship with humans swinging between their augmentation and replacement Now as AI technologies enter our everyday lives at an ever increasing pace there is a greater need for AI systems to work synergistically with humans One critical requirement for such synergistic human AI interaction is that the AI systems behavior be explainable to the humans in the loop To do this effectively AI agents need to go beyond planning with their own models of the world and take into account the mental model of the human in the loop At a minimum AI agents need approximations of the human's task and goal models as well as the human's model of the AI agent's task and goal models The former will guide the agent to anticipate and manage the needs desires and attention of the humans in the loop and the latter allow it to act in ways that are interpretable to humans by conforming to their mental models of it and be ready to provide customized explanations when needed The authors draw from several years of research in their lab to discuss how an AI agent can use these mental models to either conform to human expectations or change those expectations through explanatory communication While the focus of the book is on cooperative scenarios it also covers how the same mental models can be used for obfuscation and deception The book also describes several real world application systems for collaborative decision making that are based on the framework and techniques developed here Although primarily driven by the authors own research in these areas every chapter will provide ample connections to relevant research from the wider literature The technical topics covered in the book are self contained and are accessible to readers with a basic background in AI

Cognitive Semantics of Artificial Intelligence: A New Perspective Alexander Raikov, 2021-02-02 This book addresses the issue of cognitive semantics aspects that cannot

be represented by traditional digital and logical means The problem of creating cognitive semantics can be resolved in an indirect way The electromagnetic waves quantum fields beam of light chaos control relativistic theory cosmic string recognition category theory group theory and so on can be used for this aim Since the term artificial intelligence AI appeared various versions of logic have been created many heuristics for neural networks deep learning have been made new nature like algorithms have been suggested At the same time the initial digital logical and neural network principles of representation of knowledge in AI systems have not changed a lot The researches of these aspects of cognitive semantics of AI are based on the author s convergent methodology which provides the necessary conditions for purposeful and sustainable convergence of decision making
