Investigation of Alternative Fuels and Advanced Engine Technology Vi Hai Rapp, 2011 The internal combustion engine has vastly improved over the past 100 years With global warming and pollution being a rising concern engineers are working towards improving efficiency and emissions of engines The spark ignited engine or gasoline engine offers improvement in emissions with a sacrifice in thermal efficiency The compression ignition engine Diesel engine increases the thermal efficiency due to operation at higher compression ratios but emits high amounts of particulate matter and oxides of nitrogen NOx Although improvements in fuel refinement have decreased the amount of engine pollutants the output of pollutants for both spark ignited and Diesel engines is still too great This dissertation explores two advanced engine concepts with alternative fuels for improving thermal efficiency and reducing emissions in automobiles The first concept

investigated is a spark ignited internal combustion engine operating using hydrogen oxygen and argon Basic engine theory predicts such an engine will see a considerable improvement in engine efficiency theoretically 75% and in practice 50% including heat transfer and friction losses over standard engines These gains in thermal efficiency are due to argon s monatomic structure which yields a high specific heat ratio $\gamma = 1.67$ compared to $\gamma = 1.4$ *Advanced Engine Performance Diagnosis* James D.
