

# Multilevel bus architectures

- Don't want one bus for all communication
  - Peripherals would need high-speed, processor-specific bus interface
    - excess gates, power consumption, and cost; less portable
  - Too many peripherals slows down bus

- **Processor-local bus** 
  - High speed, wide, most frequent communication
  - Connected to cache, memory controllers, etc.

Shiva, 2005-09-20 Despite the tremendous advances in performance enabled by modern architectures there are always new applications and demands arising that require ever increasing capabilities Keeping up with these demands requires a deep seated understanding of contemporary architectures in concert with a fundamental understanding of basic principles that allows one to anticipate what will be possible over the system s lifetime *Advanced Computer Architectures* focuses on the design of high performance supercomputers with balanced coverage of the hardware software structures and application characteristics This book is a timeless distillation of underlying principles punctuated by real world implementations in popular current and past commercially available systems It briefly reviews the basics of uniprocessor architecture before outlining the most popular processing paradigms performance evaluation and cost factor considerations This builds to a discussion of pipeline design and vector processors data parallel architectures and multiprocessor systems Rounding out the
