Course In Mathematical Logic:

A Course in Mathematical Logic J.L. Bell, Moshé Machover, 1977-01-15 A comprehensive one year graduate or advanced undergraduate course in mathematical logic and foundations of mathematics No previous knowledge of logic is required the book is suitable for self study Many exercises with hints are included **A Course in Mathematical Logic** I. Manin, 1977 1 This book is above all addressed to mathematicians It is intended to be a textbook of mathematical logic on a sophisticated level presenting the reader with several of the most significant discoveries of the last ten or fifteen years These include the independence of the continuum hypothesis the Diophantine nature of enumerable sets the impossibility of finding an algorithmic solution for one or two old problems All the necessary preliminary material including predicate logic and the fundamentals of recursive function theory is presented systematically and with complete proofs We only assume that the reader is familiar with naive set theoretic arguments In this book mathematical logic is presented both as a part of mathematics and as the result of its self perception Thus the substance of the book consists of difficult proofs of subtle theorems and the spirit of the book consists of attempts to explain what these theorems say about the mathematical way of thought Foundational problems are for the most part passed over in silence Most likely logic is capable of justifying mathematics to no greater extent than biology is capable of justifying life 2 The first two chapters are devoted to predicate logic The presentation here is fairly standard except that semantics occupies a very dominant position truth is introduced before deducibility and models of speech in formal languages precede the systematic study of syntax **Course of Mathematical Logic** R. Fraïssé, 1973 This book is addressed primarily to researchers specializing in mathematical logic It may also be of interest to students completing a Masters Degree in mathematics and desiring to embark on research in logic as well as to teachers at universities and high schools mathematicians in general or philosophers wishing to gain a more rigorous conception of deductive reasoning The material stems from lectures read from 1962 to 1968 at the Faculté des Sciences de Paris and since 1969 at the Universities of Provence and Paris VI The only prerequisites demanded of the reader are elementary combinatorial theory and set theory We lay emphasis on the semantic aspect of logic rather than on syntax in other words we are concerned with the connection between formulas and the multirelations or models which satisfy them In this context considerable importance attaches to the theory of relations which yields a novel approach and algebraization of many concepts of logic The present two volume edition considerably widens the scope of the original French one volume edition 1967 Relation Formule logique Compacité Complétude The new Volume 1 1971 Relation et Formule logique reproduces the old Chapters 1 2 3 4 5 and 8 redivided as follows Word formula Chapter 1 Connection Chapter 2 Relation operator Chapter 3 Free formula Chapter 4 Logical formula denumerable model theorem Löwenheim Skolem Chapter 5 Completeness theorem Gödel Herbrand and Interpolation theorem Craig Lyndon Chapter 6 Interpretability of relations Chapter 7 **Logic of Mathematics** Zofia Adamowicz, Paweł Zbierski, 2011-09-26 A thorough accessible and rigorous

presentation of the central theorems of mathematical logic ideal for advanced students of mathematics computer science and logic Logic of Mathematics combines a full scale introductory course in mathematical logic and model theory with a range of specially selected more advanced theorems Using a strict mathematical approach this is the only book available that contains complete and precise proofs of all of these important theorems Gödel's theorems of completeness and incompleteness The independence of Goodstein's theorem from Peano arithmetic Tarski's theorem on real closed fields Matiyasevich's theorem on diophantine formulas Logic of Mathematics also features Full coverage of model theoretical topics such as definability compactness ultraproducts realization and omission of types Clear concise explanations of all key concepts from Boolean algebras to Skolem Löwenheim constructions and other topics Carefully chosen exercises for each chapter plus helpful solution hints At last here is a refreshingly clear concise and mathematically rigorous presentation of the basic concepts of mathematical logic requiring only a standard familiarity with abstract algebra Employing a strict mathematical approach that emphasizes relational structures over logical language this carefully organized text is divided into two parts which explain the essentials of the subject in specific and straightforward terms Part I contains a thorough introduction to mathematical logic and model theory including a full discussion of terms formulas and other fundamentals plus detailed coverage of relational structures and Boolean algebras Gödel's completeness theorem models of Peano arithmetic and much more Part II focuses on a number of advanced theorems that are central to the field such as Gödel's first and second theorems of incompleteness the independence proof of Goodstein's theorem from Peano arithmetic Tarski's theorem on real closed fields and others No other text contains complete and precise proofs of all of these theorems With a solid and comprehensive program of exercises and selected solution hints Logic of Mathematics is ideal for classroom use the perfect textbook for advanced students of mathematics computer science and logic

A First Course in Mathematical Logic and Set Theory
Michael L. O'Leary, 2015-09-14 A mathematical introduction to the theory and applications of logic and set theory with an emphasis on writing proofs Highlighting the applications and notations of basic mathematical concepts within the framework of logic and set theory A First Course in Mathematical Logic and Set Theory introduces how logic is used to prepare and structure proofs and solve more complex problems The book begins with propositional logic including two column proofs and truth table applications followed by first order logic which provides the structure for writing mathematical proofs Set theory is then introduced and serves as the basis for defining relations functions numbers mathematical induction ordinals and cardinals The book concludes with a primer on basic model theory with applications to abstract algebra A First Course in Mathematical Logic and Set Theory also includes Section exercises designed to show the interactions between topics and reinforce the presented ideas and concepts Numerous examples that illustrate theorems and employ basic concepts such as Euclid's lemma the Fibonacci sequence and unique factorization Coverage of important theorems including the well ordering theorem completeness theorem compactness theorem as well as the theorems of Löwenheim Skolem Burali Forti Hartogs

Cantor Schr der Bernstein and K nig An excellent textbook for students studying the foundations of mathematics and mathematical proofs A First Course in Mathematical Logic and Set Theory is also appropriate for readers preparing for careers in mathematics education or computer science In addition the book is ideal for introductory courses on mathematical logic and or set theory and appropriate for upper undergraduate transition courses with rigorous mathematical reasoning involving algebra number theory or analysis A Course in Mathematical Logic IU. recursion theory a topic essential for the complete scientist Then follows Gödel's incompleteness theorems and axiomatic set theory Chapter 8 provides an introduction to model theory There are examples throughout each section and varied selection of exercises at the end Answers to the exercises are given in the appendix

1 The first edition of this book was published in 1977 The text has been well received and is still used although it has been out of print for some time In the intervening three decades a lot of interesting things have happened to mathematical logic i Model theory has shown that insights acquired in the study of formal languages could be used fruitfully in solving old problems of conventional mathematics ii Mathematics has been and is moving with growing acceleration from the set theoretic language of structures to the language and intuition of higher categories leaving behind old concerns about infinities a new view of foundations is now emerging iii Computer science a no nonsense child of the abstract computability theory has been creatively dealing with old challenges and providing new ones such as the P NP problem Planning additional chapters for this second edition I have decided to focus on model theory the conspicuous absence of which in the first edition was noted in several reviews and the theory of computation including its categorical and quantum aspects The whole Part IV Model Theory is new I am very grateful to Boris I Zilber who kindly agreed to write it It may be read directly after Chapter II The contents of the first edition are basically reproduced here as Chapters I VIII Section IV 7 on the cardinality of the continuum is completed by Section IV 7 3 discussing H Woodin's discovery
