Innovations in Major World Oil Crops, Volume 1 S.K. Gupta,2011-10-27 Major world oil crops and their products are among the most valuable commodity in today s world trade Over the past couple of decades oilseed production has increased to become the most important world sources of vegetable oils in response to the rising world population and living standard Recent technological advances made in breeding major world oil crops have led to higher production and improved product quality This comprehensive volume encompasses recent innovations and practice in the production and use of different oil crops including Brassica Sunflower Safflower Cottonseed Castor Olive Coconut Oilpalm Sesame Groundnut and Soybean The contributors are leading specialists from different countries of the world Much of the literature available on these crops is not up to date hence this volume is a ready reference for researchers breeders biotechnologists industrialists and nutritionists Dr Surinder Kumpar Gupta born in 1959 is currently working as Professor Chief Scientist Oilseeds Plant Breeding Genetics and Nodal officer in the School of Biotechnology S K University of Agricultural Sciences Technology He holds a brilliant academic and service record and has been devoted to research on Oilseed Brassicas for nearly two decades He obtained his post graduate degree and PhD from Punjab Agricultural University He is a recipient of a post doctoral Fellowship in Plant Biotechnology and has published more than 100 research papers in esteemed national and international journals mostly on Brassicas He has already developed five varieties of rapeseed mustard and has written two books and edited three volumes on rapeseed mustard breeding For his excellent scientific endeavors he has been conferred the Young Scientists Award 1993 1994 by the State Department of Science Technology **Genetic Resources, Chromosome**

Engineering, and Crop Improvement Ram J. Singh,2006-11-02 Summarizing landmark research Volume 4 of this essential seriesfurnishes information on the availability of germplasm resources that breeders can exploit for producing high yielding oilseed crop varieties Written by leading international experts this volume presents the most up to date information on

employing genetic resources to increase crop productivity. *The Sorghum Genome* Sujay Rakshit, Yi-Hong Wang, 2017-01-18 This book provides insights into the current state of sorghum genomics. It particularly focuses on the tools and strategies employed in genome sequencing and analysis, public and private genomic resources, and how all this information is leading to direct outcomes for plant breeders. The advent of affordable whole genome sequencing in combination with existing cereal functional genomics data has enabled the leveraging of the significant novel diversity available in sorghum, the genome of which was fully sequenced in 2009, providing an unmatched resource for the genetic improvement of sorghum and other grass species. Cultivated grain sorghum is a food and feed cereal crop adapted to hot and dry climates and is a staple for 500 million of the world's poorest people. Globally, sorghum is also an important source of animal feed and forage, an emerging biofuel crop, and a model for C4 grasses, particularly genetically complex sugarcane.

Wild Crop Relatives: Genomic and Breeding Resources Chittaranjan Kole, 2011-02-21 Wild crop relatives are now playing a significant part in the elucidation and improvement of the genomes of their cultivated counterparts. This work includes comprehensive examinations of the status, origin, distribution, morphology, cytology, genetic diversity, and available genetic and genomic resources of numerous wild crop relatives, as well as of their evolution and phylogenetic relationship. Further topics include their role as model plants, genetic erosion and conservation efforts, and their domestication for the purposes of bioenergy, phytomedicines, nutraceuticals, and phytoremediation. *Wild Crop Relatives: Genomic and Breeding Resources* comprises 10 volumes on Cereals, Millets, and Grasses, Oilseeds, Legume Crops, and Forages, Vegetables, Temperate Fruits, Tropical and Subtropical Fruits, Industrial Crops, Plantation and Ornamental Crops, and Forest Trees. It contains 125 chapters written by nearly 400 well-known authors from about 40 countries.

Vegetable Crops Pritam Kalia, 2025-04-24 The volume on Vegetable Crops, as a part of a series entitled *Handbooks of Crop Diversity, Conservation, and Use of Genetic Resources*, will be a unique resource, first of its kind, which will elaborate on origin, evolution, taxonomy, identification, chemical characterization, and genetic improvement of Vegetable Crops. Vegetable crops are an important group of crops comprising solanaceous vegetables, Cole crops, Cucurbitaceous crops, Bulb crops, Root crops, Tuber crops, legume vegetables, leafy salad vegetables, Okra, etc. There is tremendous diversity within each group of vegetable crops. This genetic diversity is from the point of view of landraces and varieties of vegetable crop species used for food, processing, nutraceuticals, pharmaceuticals, etc. Vegetables, being an integral part of human diet, being a rich source of diverse nutrients such as vitamins, minerals, and antioxidants, they play an important role in balancing the diet and tackling malnutrition. Besides, due to their intensive cultivation, they also play an important role in enhancing per unit area production and productivity, cropping intensity, enhancing thereby the farmers' income, especially that of small and marginal farmers, and providing job opportunities. The genetic improvement of vegetable crops facilitates continued breeding of varieties with greater resilience to stresses and productivity, which is mainly dependent on overall genetic variation found in individuals belonging to the cultivated species and/or ancestral species related to cultivated species of vegetable crops. Since

genes of interest can be tapped from plant sources for their introduction through controlled breeding processes for genetic improvement and incorporating of desirable external and internal quality traits therefore accessibility to the information about these plant genetic resources is key to the success of the breeding efforts Since there is a need of comprehensive information about the genetic resources therefore it is important to facilitate their conservation and long term sustainable use in research and improvement The comprehensive information on the availability of genetic diversity in each vegetable crop species in this volume would facilitate priority conservation in gene banks research and use in vegetable crop improvement Realizing the importance of genetic variability in the improvement of vegetable crops from the point of view of biotic and abiotic stress resistance enhanced micronutrient climate change enhanced shelf life nutraceuticals bioactive compounds especially national and international efforts further need to be stepped up for collection characterization evaluation and conservation of vegetable crops genetic resources to facilitate search for new genes research and their use in vegetable crops improvement During 21st century genomics and marker assisted tools have gained importance for hastening the crop improvement programmes by enhancing breeding efficiency Realizing that population in South Asia and Southeast Asia is facing acute problem of under and malnutrition the emphasis on dietary diversification with vegetables is therefore being stressed Besides to enhance farmers income much emphasis is being laid on development of varieties having diverse maturity growth habit resistance to diseases and insect pest to reduce the use pesticides enhanced nutrients and shelf life For these traits we have to look into landraces and wild relatives for the traits of interest Therefore it has been felt to bring out a vegetable volume with additional accessory and supplemental information analyses and specifically filtered information which can go a long way in promoting research search for new genes alleles revealing the opportunities available for exploitation of PGR in generation of cultivars to meet upcoming challenges of vegetable crop improvement and diversification and requirement of cultivars for processing nutraceutical and pharmaceutical industry which will promote contract farming This will also help identification of geographical and genetic diversity gaps for future search of new genes collections Plant Genetic Resources PGR serve as treasures of genes of interest for developing improved future vegetable varieties hybrids besides being key to scientific efforts of developing gene pyramided varieties they are important for mitigating various challenges posed by increasing population climate change and health conscious society looking for nutraceuticals The proposed vegetable volume on agro biodiversity conservation and use of plant genetic resources with information on available genetic diversity among various groups of vegetable crops and component cultivated species with in a group of food and agriculture in all possible perspectives would be able to reflect the opportunity available for genetic engineering of vegetable crop species It will also go a long way in facilitating more predictive and productive genetic engineering programme to breed futuristic vegetable crops varieties hybrids

Millet and Sorghum Jagannath V. Patil, 2016-12-20 Millet and sorghum are

extremely important crops in many developing nations and because of the ability of many of them to thrive in low moisture situations they represent some exciting opportunities for further development to address the continuing and increasing impact of global temperature increase on the sustainability of the world's food crops. The main focus of this thorough new book is the potential for crop improvement through new and traditional methods with the book's main chapters covering the following crops: sorghum, pearl millet, finger millet, foxtail millet, proso millet, little millet, barnyard millet, kodo millet, tef, and fonio. Further chapters cover pests and diseases, nutritional and industrial importance, novel tools for improvement, and seed systems in millets. *Millets and Sorghum* provides full and comprehensive coverage of these crucially important crops, their biology, world status, and potential for improvement and is an essential purchase for crop and plant scientists and food scientists and technologists throughout the developed and developing world. All libraries in universities and research establishments where biological and agricultural sciences are studied and taught should have copies of this important book on their shelves.

Focus Japan II Erland Heginbotham, Gretchen W. Shinoda, 1993 [Drought phenotyping in crops: From theory to practice](#) Philippe Monneveux, Jean-Marcel Ribaut, Antonia Okono, 2014-02-12 This topic is a unique attempt to simultaneously tackle theoretical and practical aspects in drought phenotyping through both crop-specific and cross-cutting approaches. It is designed for and will be of use to practitioners and postgraduate students in plant science who are grappling with the challenging task of evaluating germplasm performance under different water regimes. In Part I, different methodologies are presented for accurately characterising environmental conditions, implementing trials, and capturing and analysing the information this generates, regardless of the crop. Part II presents the state of art in research on adaptation to drought and recommends specific protocols to measure different traits in major food crops, focusing on particular cereals, legumes, and clonal crops. The topic is part of the CGIAR Generation Challenge Programme's efforts to disseminate crop research information, tools, and protocols for improving characterisation of environments and phenotyping conditions. The goal is to enhance expertise in testing locations and to stimulate the development and use of traits related to drought tolerance, as well as innovative protocols for crop characterisation and breeding.
