## Rule-based deduction systems

The way in which a piece of knowledge is expressed by a human expert carries important information, example: if the person has fever and feels tummy-pain then she may have an infection. In logic it can be expressed as follows:

$$\forall x. (\text{has\_fever}(x) \ \& \ \text{tummy\_pain}(x) \ \rightarrow \ \text{has\_an\_infection}(x))$$

If we convert this formula to clausal form we lose the content as then we may have equivalent formulas like:

$$(i) \ \text{has\_fever}(x) \ \& \ \sim\text{has\_an\_infection}(x) \ \rightarrow \ \sim\text{tummy\_pain}(x)$$

$$(ii) \ \sim\text{has\_an\_infection}(x) \ \& \ \text{tummy\_pain}(x) \ \rightarrow \ \sim\text{has\_fever}(x)$$

We notice that (i) and (ii) despite being logically equivalent to the original sentence have lost the main information contained in its formulation.

## Deduction Systems:

Deduction Systems Rolf Socher-Ambrosius, Patricia Johann, 2012-12-06 The idea of mechanizing deductive reasoning can be traced all the way back to Leibniz who proposed the development of a rational calculus for this purpose But it was not until the appearance of Frege's 1879 *Begriffsschrift* not only the direct ancestor of contemporary systems of mathematical logic but also the ancestor of all formal languages including computer programming languages Dav83 that the fundamental concepts of modern mathematical logic were developed Whitehead and Russell showed in their *Principia Mathematica* that the entirety of classical mathematics can be developed within the framework of a formal calculus and in 1930 Skolem Herbrand and Godel demonstrated that the first order predicate calculus which is such a calculus is complete i e that every valid formula in the language of the predicate calculus is derivable from its axioms Skolem Herbrand and Godel further proved that in order to mechanize reasoning within the predicate calculus it suffices to Herbrand consider only interpretations of formulae over their associated universes We will see that the upshot of this discovery is that the validity of a formula in the predicate calculus can be deduced from the structure of its constituents so that a machine might perform the logical inferences required to determine its validity With the advent of computers in the 1950s there developed an interest in automatic theorem proving

*Cut Elimination in Categories* K. Dosen, 2013-04-18 Proof theory and category theory were first drawn together by Lambek some 30 years ago but until now the most fundamental notions of category theory as opposed to their embodiments in logic have not been explained systematically in terms of proof theory Here it is shown that these notions in particular the notion of adjunction can be formulated in such a way as to be characterised by composition elimination Among the benefits of these composition free formulations are syntactical and simple model theoretical geometrical decision procedures for the commuting of diagrams of arrows Composition elimination in the form of Gentzen's cut elimination takes in categories and techniques inspired by Gentzen are shown to work even better in a purely categorical context than in logic An acquaintance with the basic ideas of general proof theory is relied on only for the sake of motivation however and the treatment of matters related to categories is also in general self contained Besides familiar topics presented in a novel simple way the monograph also contains new results It can be used as an introductory text in categorical proof theory

*Parsing Schemata* Klaas Sikkel, 2012-12-06 Parsing the syntactic analysis of language has been studied extensively in computer science and computational linguistics Computer programs and natural languages share an underlying theory of formal languages and require efficient parsing algorithms This introduction reviews the theory of parsing from a novel perspective It provides a formalism to capture the essential traits of a parser that abstracts from the fine detail and allows a uniform description and comparison of a variety of parsers including Earley Tomita LR Left Corner and Head Corner parsers The emphasis is on context free phrase structure grammar and how these parsers can be extended to unification formalisms The book combines mathematical rigor with high readability and is suitable as a graduate course text

Hybrid Logic and its Proof-Theory Torben Braüner, 2010-11-17 This is the first book length treatment of hybrid logic and its proof theory Hybrid logic is an extension of ordinary modal logic which allows explicit reference to individual points in a model where the points represent times possible worlds states in a computer or something else This is useful for many applications

for example when reasoning about time one often wants to formulate a series of statements about what happens at specific times There is little consensus about proof theory for ordinary modal logic Many modal logical proof systems lack important properties and the relationships between proof systems for different modal logics are often unclear In the present book we demonstrate that hybrid logical proof theory remedies these deficiencies by giving a spectrum of well behaved proof systems natural deduction Gentzen tableau and axiom systems for a spectrum of different hybrid logics propositional first order intensional first order and intuitionistic

**Natural Deduction, Hybrid Systems and Modal Logics** Andrzej Indrzejczak, 2010-07-03 A good title should be informative enough to illuminate a potential reader on the content of a book We hope that the present title gives at least some hints of what this book is about The notion of natural deduction or modal logic are rather well known but the notion of hybrid system certainly needs some explanation In short this study may be seen as a kind of search for good deductive systems We think of systems good in practice which may be applied with ease not only by well trained logicians but also for example by philosophers who need handy deductive tools accompanying their analyses In particular we are interested in providing systems that may be widely applied in teaching logic Nowadays one may observe that several courses in critical thinking tend to eliminate courses in practical logic On the other hand logic is often taught as a strictly mathematical discipline in very demanding courses It is important to fill the gap between these extrema and the crucial ingredient of any course which is supposed to teach how to use logic is certainly a suitable deductive system Since we address this work to a wide audience interested in applications of logic we were trying to make it self contained and accessible to a reader with no hard training in logic The assumed reader should have some background in logic an elementary course covering classical propositional and first order logic with basics of set theory is enough but not necessarily in modal logic
