Structural Studies of Alpha-lytic Protease at Sub-Angstrom Resolution Reveal Insights Into the Mechanisms of Serine Protease Catalysis and Kinetic Stability Cynthia Nichole Fuhrmann, 2005 For many decades alpha lytic protease alpha LP an extracellular bacterial protease secreted by *Lysobacter enzymogenes* has served as a model in both mechanistic and structural studies for chymotrypsin like serine proteases In order to address questions regarding the catalytic mechanism of serine proteases I determined three structures of alpha LP at ultra high resolution 1 the free enzyme at its active pH alpha LP pH 8 0 83 resolution 2 alpha LP at pH5 alpha LP pH 5 0 82 resolution and 3 alpha LP bound to a peptidyl boronic acid inhibitor McOSuc Ala Ala Pro boroVal alpha LP boroVal gol 0 90 resolution The latter two structures provided analogs to the transition states of the catalytic reaction The unexpected covalent binding of a glycerol molecule to the tetrahedral boronate in alpha LP boroVal gol provided the most accurate and highly resolved model of the tetrahedral intermediate for acylation TI 1 determined to date Structure specific radiation damage was apparent in electron density for these structures and special data collection techniques were used to minimize radiation damage observed at the Ser195 boronic acid adduct A comparison of all three structures elucidated the structural changes that occur during the first step of

the catalytic reaction ES arrow right TI 1 We propose that upon deprotonation of His57 Ser195 undergoes a conformational change that is responsible for preventing the TI 1 arrow right ES back reaction Based on precise atomic positions obtained at sub ngstrom resolution we have concluded that the His57 Asp102 interaction is a standard ionic hydrogen bond in both the free enzyme and the acylation transition state and not a low barrier hydrogen bond as had been previously debated Instead I propose that transition state stabilization by chymotrypsin like serine proteases is achieved through a network of optimized hydrogen bonds that position the catalytic triad and stabilize the Ser195 substrate tetrahedral adduct In particular I identified a short ionic hydrogen bond between His57 and the amide of the substrate leaving group that may play the primary role in catalyzing the second step of the acylation reaction A surprising outcome from these studies was the discovery of a site of conformational strain that appears to be evolutionarily linked to alpha LP s kinetic stability Distortion of Phe228 a conserved residue in the protein core is estimated to account for 4 kcal mol in conformational energy The rearrangement and subsequent distortion of Phe228 by co evolved residues surrounding it supports the hypothesis that tight packing in alpha LP is a key component of alpha LP s folding energy landscape Subsequent mutational studies support this hypothesis confirming our discovery of the first known functionally relevant distortion
