Aspects Of Animal Movement:

Animal Movement Across Scales Lars-Anders Hansson, Susanne Åkesson, 2014 This study takes a broad and timely approach to animal movement across both temporal and spatial scales Movement and migration on land in the air and in water are pervading features of animal life from the smallest protozoans to the largest whales and can extend from millimetres to global scale Research into animal movement ecology is now entering a new era with the development of novel molecular electronic and technical methods that make it possible to analyse the movements of individual animals under complex environmental conditions that determine the evolution of movement habits *Animal Locomotion* Andrew A. Biewener, 2003-06-19 This book provides a clear foundation based on physical biology and biomechanics for understanding the underlying mechanisms by which animals have evolved to move in their physical environment It integrates the biomechanics of animal movement with the physiology of animal energetics and the neural control of locomotion The author also communicates a sense of the awe and fascination that comes from watching the grace speed and power of animals in motion Movement is a fundamental distinguishing feature of animal life and a variety of extremely effective mechanical and physiological designs have evolved Common themes are observed for the ways in which animals successfully contend with the properties of a given physical environment across diversity of life forms and varying locomotor modes Understanding the common principles of design that span a diverse array of animals requires a broad comparative and integrative approach to their study This theme persists throughout the book as various modes and mechanisms of animal locomotion are covered Since an animal's size is equally critical to its functional design the effects of scale on locomotor energetics and mechanics are also discussed Biewener begins by examining the underlying machinery for movement skeletal muscles used for force generation skeletons used for force transmission and spring like elements used for energy savings He then describes the basic mechanisms that animals have evolved to move over land in and on the surface of the water and in the air Common fluid dynamic principles are discussed as background to both swimming and flight In addition to discussing the locomotor mechanisms of complex animals the locomotor movement of single cells is also covered Common biochemical features of cellular metabolism are then reviewed before discussing the energetic aspects of various locomotor modes Strategies for conserving energy and moving economically are again highlighted in this section of the book Emphasis is placed on comparisons of energetic features across locomotor modes The book concludes with a discussion of the neural control of animal locomotion The basic neurosensory and motor elements common to vertebrates and arthropods are discussed and features of sensori motor organization and function are highlighted These are then examined in the context of specific examples of how animals control the rhythmic patterns of limb and body movement that underlie locomotor function and stability [Society for Experimental Biology, Seminar Series: Volume 5, Aspects of Animal Movement](#) H. Spatiotemporal Analysis of Animal Movement and Interactions Brendan Arthur Hoover,2020 The spatiotemporal aspects of animal telemetry data collected using technologies such as global positioning systems GPS and acoustic sensors has become a critical area of ecological research This dissertation contributes to the computational analysis of animal movement by analyzing and introducing methods to facilitate the analysis and interpretation of animal movement specifically their use of space and their interactions In Chapter 2 time based home range methods were evaluated for accuracy in terms of area shape and location in response to sample size and common wildlife GPS point patterns These characteristics of home range estimation are important for inferring animal habitat and resource use Despite the improved accuracy of time based methods compared to traditional point based methods location was often inaccurate for all GPS point patterns as were shape and area for GPS point patterns with perforations common for areas with large physical barriers like mountains or lakes Therefore future research should focus on methods aimed at improving home range accuracy Animal interactions are an important aspect of animal behavioral ecology that impacts processes like predation mating and disease spread Interactions are spatially and temporally variable and can occur either through direct contact or at asynchronous spaces and or times Chapter 3 introduces a method termed the temporally asynchronous joint potential path area ta jPPA that maps potential areas of spatially synchronous temporally asynchronous interactions in order to link interactions to landscape features or other environmental variables Given the spatiotemporal nature of animal movements analysis metrics that quantify interaction often use subjective thresholds to subset or classify telemetry data In Chapter 4 an unsupervised learning technique is presented as an exploratory data analysis tool that uses the spatiotemporal properties of two animal trajectories to uncover spatiotemporal analysis thresholds These thresholds are not meant to replace expert knowledge of a species being studied but to be used when no knowledge exists as well as to explore different spatiotemporal scales of interaction Using simulated data the method was able to distinguish interactions from random movement found appropriate thresholds based on derived models and with empirical data the method was able to find patterns that were consistent with previously observed behavior
