In order to simulate human intellect in robots a vast and interdisciplinary discipline known as artificial intelligence AI integrates computer science data analysis and problem solving strategies It entails the creation of algorithms and systems that give computers the ability to observe comprehend reason pick up new information and make decisions Fundamentally AI strives to build intelligent computers that can work independently adapt to new circumstances and display traits that resemble human intelligence Machine learning and deep learning are two important subfields and methodologies within the umbrella of artificial intelligence AI The main goal of machine learning is to create algorithms that let computers learn from data and get better at what they do without being explicitly taught Deep learning a subset of machine learning processes and analyses complicated data using artificial neural networks modelled after the structure and operation of the human brain AI's main objective is to create machines that can carry out tasks that have historically required human intelligence like speech and picture recognition natural language processing decision making problem solving and even creative activities These systems use enormous databases and computational capacity to do amazing feats as they attempt to comprehend analyse and respond to the complexity of the world AI algorithms can find patterns connections and insights by analysing and processing enormous amounts of data that may escape human observers Significant improvements in a variety of fields such as business education finance and social media have been made possible by this skill By automating procedures improving judgement personalising interactions and gleaning important insights from vast amounts of data AI is

Embedding Artificial Intelligence into ERP Software Siar Sarferaz, 2024-05-30 This book explains how to embed artificial intelligence in digitized business processes of ERP software by solving the two related substantial challenges: how can artificial intelligence be systematically integrated into ERP business processes for ease of consumption, and how can artificial intelligence be made enterprise-ready by covering ERP qualities like compliance, lifecycle management, extensibility, or scalability. As a general introduction, the first part of this book takes the reader through a historical journey towards intelligent ERP systems. In addition, reference processes and a reference architecture for ERP systems are proposed, which build the foundation for the suggested subsequent solution concept, including a method for operationalizing intelligence for ERP business processes. Subsequently, in the second part, detailed concepts of embedding artificial intelligence into ERP software are proposed. In this context, the suggested solution architecture is depicted, and specific topics are resolved, like data integration, model validation, explainability, data protection, and privacy, model degradation, and performance. In the last part, an implementation framework is suggested, which enables the previously introduced concepts and harmonizes the development and operations of artificial intelligent ERP applications. This part concludes with case studies considering artificial intelligence scenarios of SAP S/4HANA in the areas of logistics, finance, and sales, which apply the defined solution approach and show its real-world feasibility. This book is written for professionals who want to implement, as developers or exploit, as business analysts or consultants, or consider, plan, the implementation, exploitation, as managers of artificial intelligence in business information systems.
