specialized domains has gradually brought new insights and led to essential adjustments in how the relations are seen. At the same time, datasets which encompass these phenomena have become available. They started small, then grew somewhat, then became truly large. The large resources are inevitably noisy because they are constructed automatically. The available corpora to be analyzed or used to gather relational evidence have also grown, and some systems now operate at the Web scale. The learning of semantic relations has proceeded in parallel in adherence to supervised, unsupervised, or distantly supervised paradigms. Detailed analyses of annotated datasets in supervised learning have granted insights useful in developing unsupervised and distantly supervised methods. These in turn have contributed to the understanding of what relations are and how to find them, and that has led to methods scalable to Web-sized textual data. The size and redundancy of information in very large corpora, which at first seemed problematic, have been harnessed to improve the process of relation extraction learning. The newest technology, deep learning, supplies innovative and surprising solutions to a variety of problems in relation learning. This book aims to paint a big picture and to offer interesting details.

Natural Language Interfaces for Databases with Deep Learning George Katsogiannis-Meimarakis, Anna Mitsopoulou, Mike Xydas, Georgia

Koutrika, 2025-11-12. This book covers the main research areas that aim to bridge the world of databases and SQL with the world of natural language. It provides a comprehensive coverage of the most influential work in the field that takes advantage of deep learning. Enabling users to access databases using natural language has been a longstanding goal since the inception of relational databases, but despite continued efforts, it remains an open challenge. However, the advancement of neural networks has given new life to this area, inspiring a new wave of works in multiple directions. Starting with an introduction on the history of NLIDBs and a brief neural primer on deep learning architectures frequently mentioned throughout the book, the initial chapters focus on the Text to SQL problem. There, an overview of the problem is given, followed by a general architecture of Text to SQL systems and a deeper analysis of specific systems. Additionally, the reverse process of explaining an SQL query, i.e. SQL to Text, is examined along with open research problems and the currently available solutions. The book continues with the multi-turn Text to SQL problem that enables users to make corrections or ask follow-up questions, outlining the underlying system architectures and introducing key representative systems. To put everything into perspective, the subsequent chapter takes a broader look at the more general areas of code understanding and generation that encapsulate the problems discussed in the previous chapters. Moving on, the focus shifts on generating NL explanations and summaries of data, i.e. the Data to Text problem, offering an overview of the problem and its challenges, as well as an overall system architecture and specific Data to Text systems. Then, bringing Data to Text closer to NLIDBs, the book dives deeper into the Results to Text problem that focuses on how to express the result of a query in user-friendly natural language. Finally, the book concludes by offering insights into how all the discussed research areas and systems can be brought together to create an NLIDB, along with risks and challenges that must be considered in the process. This book is intended for both

researchers and practitioners interested in NLIDBs regardless of their prior familiarity with the topic Readers with experience in this area will benefit from a structured overview and categorization of existing systems along with an in depth analysis of benchmarks persistent challenges and open research questions Conversely newcomers can explore the landscape of neural NLIDBs through an accessible presentation of the relevant subfields and key advancements without requiring any prior background knowledge
