

DECISION THEORY AND INCOMPLETE KNOWLEDGE: MAXIMUM VARIANCE

BY

Z. W. KRZYZANOWICZ AND A. D. PRUJAN

Introduction

In a recent paper in this journal, Cannon and Krzysanowicz¹ investigated problems of strategy selection when the decision-maker has certain *a priori* beliefs about the probability distribution of possible future states of nature. In their paper, they show how strategies may be compared in terms of their minimum and maximum expected payoffs, assuming only that the decision-maker has in his mind an ordinal ranking of the probabilities of states of nature. Furthermore, they demonstrate how, in such circumstances, established decision-making criteria such as maximin, maximax, minimax regret, etc., can all be improved by employing minimum and maximum *expected* payoffs rather than crude minima and maxima.

The aim of this paper is to consider the second major characteristic of probability distributions of payoffs which is likely to be of practical interest, their dispersion. It will be shown that, given assumptions identical to those made by Cannon and Krzysanowicz about probability rankings, general results may be derived about the minimum and maximum variance of the payoffs of any strategy. In the following sections these results are derived and variance calculations under additional constraints are briefly discussed. The use of extreme expected payoffs and maximum variances is then examined and finally a numerical example is given.

Extreme Variance of Strategies

Cannon and Krzysanowicz² demonstrated that, in choosing between competing strategies, minimum and maximum expected payoff will be an important criterion. It is now, however, likely to be the only one. It is also important to form a judgement as to the likely dispersion of outcomes around these mean values, as, in some cases, the decision-maker's attitude to risk may be such that he will be prepared to trade-off a higher expected return against a strategy with a lower mean value for a greater probability of an actual outcome close to that expectation.

It follows from this line of argument that any statement which can be

and empirical discoveries of preference formation time discounting social interaction and social decision making The book covers a wide range from classical to relatively recent major studies concerning behavioral decision theory which in brief is a general term for descriptive theories to explain the psychological knowledge related to people's decision making behavior It is called a theory but is actually a combination of various psychological theories for which no axiomatic systems such as those associated with the utility theory widely used in economics have been established The utility theory is often limited to qualitative knowledge however as the studies of Nobel laureates H A Simon D Kahneman and R Thaler have suggested the psychological methodology and knowledge of behavioral decision theory have been applied widely in such fields as economics business administration and engineering and are expected to become even more useful in the future Research into people's decision making represents an important part in those fields various aspects of which overlap with the scope of behavioral decision theory This theory is closely related to behavioral economics and behavioral finance which have come into greater use in recent years This book will appeal especially to graduate students advanced undergraduate students and researchers who are interested in decision making phenomena

Logic-Based Artificial Intelligence Jack Minker, 2012-12-06 The use of mathematical logic as a formalism for artificial intelligence was recognized by John McCarthy in 1959 in his paper on Programs with Common Sense In a series of papers in the 1960 s he expanded upon these ideas and continues to do so to this date It is now 41 years since

the idea of using a formal mechanism for AI arose It is therefore appropriate to consider some of the research applications and implementations that have resulted from this idea In early 1995 John McCarthy suggested to me that we have a workshop on Logic Based Artificial Intelligence LBAI In June 1999 the Workshop on Logic Based Artificial Intelligence was held as a consequence of McCarthy s suggestion The workshop came about with the support of Ephraim Glinert of the National Science Foundation IIS 9S2013S the American Association for Artificial Intelligence who provided support for graduate students to attend and Joseph JaJa Director of the University of Maryland Institute for Advanced Computer Studies who provided both manpower and financial support and the Department of Computer Science We are grateful for their support This book consists of refereed papers based on presentations made at the Workshop Not all of the Workshop participants were able to contribute papers for the book The common theme of papers at the workshop and in this book is the use of logic as a formalism to solve problems in AI
