Deburring Technology for Improved Manufacturing LaRoux K. Gillespie,1981 **Machinability of Advanced Materials** J. Paulo Davim,2014-02-19 Machinability of Advanced Materials addresses the level of difficulty involved in machining a material or multiple materials with the appropriate tooling and cutting parameters A variety of factors determine a material s machinability including tool life rate cutting forces and power consumption surface integrity limiting rate of metal removal and chip shape These topics among others and multiple examples comprise this research resource for engineering students academics and practitioners Metal Cutting Theory and Practice David A. Stephenson,1996-10-23 Provides insight into advanced tool materials physical theory and research understanding of metal cutting processes The text highlights technology developed internationally and reviews available technology of metal cutting processes such as turning boring milling and drilling It also elucidates optimum choices for tool material and cutting conditions and more

Deburring and Edge Finishing Handbook LaRoux K. Gillespie,1999 Written by industry expert LaRoux Gillespie this handbook is the most comprehensive book on burr removal and the treatment of edges ever published Armed with this in depth guide to deburring technologies any engineer involved with part manufacturing will quickly discover how to accurately identify and evaluate the most efficient and cost effective deburring option s for a specific application This groundbreaking work details 100 internationally recognized deburring and edge finishing processes you can employ It also offers you an extensive base of technical information on a vast array of tools applications and procedures available From burr prevention in the design phase to actual burr removal on the line you will be better prepared to deal with burrs and edge defects and also determine what tolerance level is acceptable for quality production standards before it becomes a shopfloor problem Learn how to weigh aesthetic and functional justifications across a wide array of mechanical thermal chemical electrical and manual techniques **Light Metal Alloys Applications** Waldemar Alfredo Monteiro,2014-06-11 Lightweight alloys have become of great importance in engineering for construction of transportation equipment At present the metals that serve as the base of the principal light alloys are aluminum and magnesium One of the most important lightweight alloys are the aluminum alloys in use for several applications structural components wrought aluminum alloys parts and plates However some casting parts that have low cost of production play important role in aircraft parts Magnesium and its alloys are among the lightest of all metals and the sixth most abundant metal on earth Magnesium is ductile and the most machinable of all metals Many of these light weight alloys have appropriately high strength to warrant their use for structural purposes and as a result of their use the total weight of transportation equipment has been considerably decreased *National Union Catalog* ,1983 *Energy Research Abstracts* ,1981 *Manufacturing Processes for Engineering Materials* Serope Kalpakjian,1997 This text offers a quantitative and analytical approach to manufacturing processes It provides a broad coverage of the major aspects of manufacturing processes and attempts to present a balanced view of the important

fundamentals analytical approaches and relevant applications Examples and end of chapter problems are included as well as a summary of formulae for each chapter

Burrs - Analysis, Control and Removal Jan C. Aurich, David A. Dornfeld, 2009-12-01 In many machining operations burrs cannot be avoided They can affect the functionality and the safe handling of the workpiece in the subsequent processing and have to be removed by a special deburring process Toleration of burrs which are not part of functional edges depends on their respective shape and size High inspection effort is necessary to guarantee the workpiece quality Therefore the research results on burrs with a focus on burr analysis and control as well as on cleanability and burr removal based on the presentations held at the conference are valuable for researchers and engineers in manufacturing development

Schey, 1987 This revision aims to address changes that have taken effect since the publication of the second edition The most significant change has been in the attitude of industry to concurrent engineering In 1987 mostly lip service was paid to it today it has become general practice in most competitive corporations In the second edition the author discussed this as the manufacturing system In the third edition it becomes the focal point Concurrent engineering involves the whole product realization process including product concept performance criteria mechanical design and analysis materials selection process planning and modeling production control automation assembly management and others An introductory text cannot possibly cover all of these topics hence the emphasis of the third edition remains on the physical principles and the application of these principles to processes The major difference relative to the second edition will be the emphasis on interactions between process and design Capabilities and limitations of processes will be highlighted to show what they mean in terms of design possibilities and design modifications will be suggested for ease of manufacture Impact on the environment and possibilities for recycling will be woven into the entire text
