## **Cell Activation:**

BCR Signaling and B Cell Activation Wanli Liu, Pavel Tolar, Wenxia Song, Tae Jin Kim, 2020-02-24      Deciphering new molecular mechanisms of mast cell activation Ulrich Blank, Marc Benhamou, 2014-03-20 Mast cells are tissue localized cells that play an important role in immunity and inflammation Following an offensive event they act as cellular sensors that via the activation of cell surface receptors launch a cellular response culminating in the release of a whole set of inflammatory mediators and products This response is initially destined to restore tissue homeostasis but in case of chronic injury or deregulation also promotes pathology To further understand the action of mast cells in their environmental context it is necessary to decipher the molecular mechanisms of their activation as well as the ensuing cellular responses This will allow identification of new strategies to promote their beneficial actions or at the contrary to interfere with their pathological consequences While in the past many studies have focused on responses engaged by high affinity IgE receptor because of its implication in the allergic response it has become clear that mast cells can be activated by multiple types of receptors initiating an intense molecular crosstalk between receptors and signaling pathways that can either synergize antagonize and in some cases produce new types of responses Mast cells can indeed react with an astounding diverse array of cellular responses that sometimes are engaged selectively This Research Topic will focus on selected articles that shed some new light on the molecular mechanisms of mast cell activation the possible crosstalk between signaling pathways and the ensuing cellular responses that allow mast cells to act as cellular sensors in tissues      **Cell Activation and Apoptosis in HIV**

**Infection** Jean-Marie Andrieu, Wei Lu, 2012-12-06 In the past decade the global efforts in the control of HIV disease were basically concentrated on the search for anti retroviral agents So far anti HIV therapies have been shown to be disappointing because of rapid development of drug resistant mutant variants Despite this drawback in the therapeutic fight against HIV infection antiviral research should be actively pursued However failure of antiviral therapy indicates that other avenues of research should be rapidly explored with the same energy In this setting striking advances have been recently made in the dissection and understanding of the viro immunological processes governing the progressive destruction of lymphoid organs associated with AIDS development and HIV induced activation and apoptosis have been identified as key phenomena of the immune system destruction This book assembles the most recent advances on basic and clinical aspects of T cell activation/apoptosis in HIV infection and their implications for immunotherapy These data were presented at an international symposium held on July 11-12 1994 in Paris The book is partitioned into 21 chapters covering four comprehensive fields 1 T cell/macrophage activation and HIV infection 2 Apoptosis and viropathogenesis of HIV disease 3 Apoptosis and immunopathogenesis of HIV disease 4 Mediators of T cell activation/apoptosis and therapeutic applications We hope that this book will assist the readers in understanding recent advances in the viro immunopathogenesis of HIV disease as well as the rationales for potential immune cell targeted therapeutic interventions      Genetic and Epigenetic Control on Immune

Responses Regulating Molecules in Cancer Development, Progression, and Treatment Katherine Chiappinelli,Alejandro Villagra ,Lidia Karabon,2024-10-16 In line with recent evidence the development of cancer has been described as uncontrolled cell growth that results from gradual accumulation of genetic and epigenetic alterations involving aberrations in oncogenes tumor suppressor genes and defects in genes engaged in DNA repair As a result cancer cells acquire a neoplastic phenotype and tumor associated antigens TAAs are presented on their surface These target structures should be recognized by cells of the immune system However a sequence of events at the genetic and epigenetic level disturb immune cells and in consequence make them unable to eliminate cancer cells Both innate and adaptive immunity are mobilized against cancer cells In response to the appearance of cells with malignant transformation NK cells release perforin and granzyme causing direct cytolysis of the target cells They can also secrete pro inflammatory cytokines and in that way enhance the anticancer response The activity of NK cells is regulated by a variety of activating and inhibitory receptors including NKG2D KIR CD94 NKG2 heterodimers and natural cytotoxicity receptors TNF family ligands as well as co stimulatory receptors which recognize related molecules on target cells A fundamental trigger of the anticancer immune response is the recognition of TAAs by T cells via the major histocompatibility complex MHC which should be followed by signals from co stimulatory molecules Full activation of T lymphocytes requires a third signal provided by the presence of cytokines and this leads to cell proliferation differentiation and secretion of chemokines and cytokines The effect is to drive the clonal expansion of the T cells directed against TAAs and to recruit other immune effector cells in order to enhance immune defense

**Biomedical Index to PHS-supported Research: pt. A. Subject access A-H** ,1992 *CD1- and MR1-restricted T Cells in Antimicrobial Immunity* S.M. Mansour Haeryfar,Thierry Mallevaey,2016-01-21 Cell mediated immunity to extracellular and intracellular microbes has been traditionally linked to CD4 and CD8 T cells that recognize pathogen derived peptides in the context of major histocompatibility complex MHC class II and class I molecules respectively Recent progress in our understanding of early host defense mechanisms has brought unconventional innate like T cells into the spotlight These are a heterogeneous population of non MHC restricted T cells that exhibit memory like properties and mount emergency responses to infection They may directly detect and destroy infected cells but are best known for their ability to regulate downstream effector cells including but not limited to conventional T cells Innate like T cells include among others CD1 restricted natural killer T NKT cells and MR1 restricted mucosa associated invariant T MAIT cells NKT cells recognize lipid antigens and MAIT cells were recently demonstrated to respond to microbe derived vitamin B metabolites However much remains to be learned about the antigen specificity range of these cells their activation mode and their true potentials in immunotherapeutic applications Like in many other areas of biology uncertainties and controversies surrounding these cells and some of the experimental models techniques and reagents employed to study them have brought about excitement and sometimes hot debates This Special Topic was launched to provide updated reviews on protective and or pathogenic roles of NKT and MAIT

cells during infection Leading experts discuss current controversies pressing questions and the challenges that lie ahead for the advancement of this intriguing and rapidly evolving area of immunology Unlike MHC CD1 and MR1 display very limited polymorphism Therefore NKT and MAIT cells may be considered attractive targets for various diseases in diverse human populations The potential benefits of NKT cell and MAIT cell based vaccination and treatment strategies in infectious diseases is an important subject that is also covered in this Topic

**Anaphylaxis and Hypersensitivity Reactions** Mariana C. Castells,2010-12-09 Despite wide recognition as a serious public health problem anaphylaxis and hypersensitivity reactions remain under recognized and under diagnosed This book fills the gaps in our understanding of the identification of triggers recognition of clinical presentations understanding of the natural history of these reactions and selection of treatment strategies including those focused on cellular and molecular targets The book provides a detailed examination of disease etiology pathogenesis and pathophysiology and their correlation to clinical practice Forefront knowledge of the mediators and mechanisms of anaphylaxis is covered with an emphasis on how new discoveries shape our current and emerging therapies
