[Autoimmunity: novel insights and future perspectives](#) Constantin Caruntu, Monica Neagu, Mihaela Adriana Ilie, Ancuta Mihai, 2025-11-25 Autoimmunity is and will be considered a hot topic in scientific research. One strong argument that maintains a high research interest in autoimmunity is represented by its dual facets: genetic and environmental. There are rapid advances in identification of various molecular players, from genes to autoantibodies, imposing the immune dysregulation that can lead to the development of diverse immune system diseases. Moreover, numerous endogenous or environmental triggers, such as chronic inflammation, medications, metabolites, viruses, bacteria, pollen, etc., are involved in the development of autoimmunity. The complexity of autoimmunity continues to amaze us.

and each new discovery in this field paves the way for additional research directions that are crucial for advancing both our fundamental understanding and practical applications in clinical settings. The immunological mechanisms that lead to autoimmune and autoinflammatory diseases are still not fully understood. The journey from emphasizing the immunological mechanisms and identifying autoantibodies as specific biomarkers to reaching the final diagnosis and establishing the therapeutic strategy is difficult and generates a significant consumption of medical resources. Therefore, the scientific community must persist in its efforts to achieve important progresses in this major research area. In this Research Topic, we aim to bring together the most recent and relevant scientific studies in the vast and complex field of autoimmunity. We invite investigators to contribute with original research and review articles bringing in the spotlight the recent findings regarding the immune system mechanisms, immunoregulatory proteins, genetic mutations that could be linked to the development of autoimmune diseases, as well as the role of inflammation, viral triggers, and environmental risk factors in autoimmunity. Of particular interest for our Research Topic will be articles focused on the new target molecules involved in the development of immunomodulatory therapies.

*Immunology, Immunopathology & Immunity* Stewart Sell, Ira Berkower, Edward E. Max, 1996. This comprehensive textbook presents a systematic account of the effects, both good and bad, of the immune system. Special emphasis is placed on what the immune system actually does in causing and preventing disease. The fifth edition is divided into three parts: discussing the fundamentals of immune mechanisms, the seven immunologic effector mechanisms contrasted and compared, and how the immune mechanisms act in disease and cancer. A new chapter on HIV infection and AIDS has been included.

**Skin Immune System (SIS)** Jan D. Bos, 1997-04-10. Immunodermatology is a field covering the majority of skin diseases, including the most prevalent ones in the general population. The Second Edition of *Skin Immune System (SIS)* discusses immune-mediated skin diseases and disease groups in which the SIS plays a role. It covers major findings in immunophysiology and immunopathology that have occurred since the introduction of the First Edition in 1990. As the subtitle indicates, the Second Edition adds a new emphasis on cutaneous immunology and also includes new information on immune-based therapeutic interventions and methods such as phototherapy and the immunological therapy of skin cancer. The book contains Part I with introductory chapters, Part II with descriptions of the cellular elements, and Part III which describes the humoral and molecular components of SIS. Part IV follows to integrate the facts described in Parts II and III into concepts of pathophysiology. It contains a number of concepts entitled response patterns that describe how the constitutional elements of SIS work together. New in this edition are the descriptions of immunodermatological diseases individually described in Part V. Part VI is also all new and summarizes principles of immunotherapy.

microenvironment TME is a complex and dynamic ecosystem that plays a critical role in cancer progression and its therapeutic response The TME is composed of various cell types including tumor stromal and immune cells These cells interact with each other in a complex manner to shape the TME and influence cancer progression Recent advances in cancer immunotherapy have demonstrated the power of harnessing the immune system to fight cancer However many patients with solid malignancies do not respond to immunotherapy This is often due to the presence of an immunosuppressive TME The overarching goal of this Research Topic is to investigate the regulation of the immune TME in solid malignancies and identify epigenetic cancer related pathways that can be targeted for therapeutic intervention This Research Topic has the potential to lead to the development of novel and more effective therapies for patients with solid malignancies through unraveling the field of cancer immunotherapy By targeting the immune TME we can overcome the major challenges of immunotherapy resistance and improve the outcomes for cancer patients Researchers are encouraged to submit Original Research articles Reviews Mini reviews Systematic Reviews Case Reports Perspectives Short communications Opinions Study Protocols and Methods relevant to this article collection that will cover topics such as but not limited to 1 Studies that characterize the composition and heterogeneity of the immune TME in solid malignancies 2 Studies that identify the players that have a crucial role in regulating the immune TME in solid malignancies 3 Reports investigating the mechanisms by which epigenetic mechanisms control the regulators of the immune TME e g T cells Tregs MDSCs CAFs 4 Studies that develop and validate novel epigenetic therapies that target the immune TME to improve the efficacy of cancer immunotherapy 5 Epigenomic profiling studies that identify the differentially expressed epigenetic regulators in the immune TME 6 In vivo animal studies that validate novel therapies targeting the immune TME 7 Clinical trials investigating novel therapeutics targeting genes involved in several cellular processes including immune cell differentiation function and trafficking

Methods in Skin Research D. Skerrow, C. J. **Pattern Recognition Receptors and Cancer** Anton G. Kutikhin, Arseniy E. Yuzhalin, 2015-10-08 The group of pattern recognition receptors PRRs includes families of Toll like receptors TLRs NOD like receptors NLRs C type lectin receptors CLRs RIG I like receptors RLRs and AIM 2 like receptors ALRs Conceptually receptors constituting these families are united by two general features Firstly they directly recognize common antigen determinants of virtually all classes of pathogens so called pathogen associated molecular patterns or simply PAMPs and initiate immune response against them via specific intracellular signaling pathways Secondly they recognize endogenous ligands since they are usually released during cell stress they are called damage associated molecular patterns DAMPs and hence PRR mediated immune response can be activated without an influence of infectious agents So pattern recognition receptors play the key role performing the innate and adaptive immune response In addition

many PRRs have a number of other vital functions apart from participation in immune response realization The fundamental character and diversity of PRR functions have led to amazingly rapid research in this field Such investigations are very promising for medicine as immune system plays a key role in vast majority if not all human diseases and the process of discovering the new aspects of the immune system functioning is rapidly ongoing The role of Toll like receptors in cancer was analyzed in certain reviews but the data are still scattered This collection of reviews systematizes the key information in the field
