Cell Adhesion:

Principles of Cell Adhesion (1995) Peter D. Richardson, Manfred Steiner, 2017-11-22 Intended for cell biologists biophysicists biochemists molecular biologists physiologists researchers in hemostasis and thrombosis and pathologists this book provides an insight into cell adhesion from three interdisciplinary perspectives fundamental facts of adhesion molecular biochemistry of adhesion and physiological aspects It summarizes the basic aspects of surfaces in general and describes the theoretical and experimental tools necessary to investigate cell adhesion including the basic biochemistry and molecular biology of adhesion The book offers concise treatment of individual topics features current material and provides key references as a guide to further study

Cell Adhesion Mary C. Beckerle, 2001 Cell adhesion plays a central role in development and disease Cell adhesion to particular ligands can affect cytoskeletal organization and cell polarity cell proliferation and gene expression This book is divided into two parts The first section provides a discussion of the structure and function of the seven major classes of cell adhesion molecules integrins cadherins selectins heparan sulfate proteoglycans the immunoglobulin superfamily the ADAMs proteins and transmembrane protein tyrosine phosphatases The roles of these cell adhesion proteins in important processes such as cell mediated immunity development and disease are discussed In the second section the molecular organization and function of junctional complexes regions of the cell surface that are highly specialized for cell adhesion are examined Junctional complexes are now known to mediate adhesive interactions and contribute to transmembrane signaling events that dramatically influence cell behaviour The biochemical organization of the adhesive membranes and the molecular mechanisms by which they transmit information to the cell are addressed Written by contributors among the most prominent in the field Cell Adhesion covers a wide range of topics in a single volume It will be a great resource for students teachers and researchers

Cell Adhesion and Migration in the Development of Multicellular Organisms Takaaki Matsui, Mitsugu Fujita, Akihiko Ito, 2019-01-24 During development cells are generated at specific locations within the embryo and then migrate into their destinations At their destinations they assemble together through cell adhesions eventually leading to the formation of tissues and organs In some cases orchestration of cell adhesion and migration produces the global movement of cell groups called collective cell migration which is also required for the development of basic tissue structures such as spheres clusters and vesicles in the morphogenetic processes of development Therefore individual regulation and orchestration of cell adhesion and migration are quite important for appropriate tissue organ formation during development However how cell adhesion and migration are regulated and orchestrated during development How cell adhesion and migration affects tissue formation during development To answer these questions we assembled several review and research articles in this eBook By assembling these articles we could explore the presence of core regulatory mechanisms and deepen the current understanding of cell adhesion and migration during the development of multicellular organisms

Metastasis: From Cell Adhesion and

Beyond Vasiliki Gkretsi, Triantafyllos Stylianopoulos, 2019-08-22 This eBook consists of a collection of articles focused on fundamental processes of cancer cell metastasis such as cell Extracellular matrix adhesions epithelial to mesenchymal transition EMT and lymph node metastasis as well as on upcoming research fields including the effects of biomechanical factors the use of analytical and statistical tools and experimental techniques to further understand and characterize the invasive and metastatic potential of tumors

Cell Adhesion Molecules Martin E. Hemler, Enrico Mihich, 2012-12-06 The Fourth Annual Pezcoller Symposium entitled Adhesion Molecules Cellular Recognition Mechanisms was held in Rovereto Italy June 24 26 1992 and was focussed on the detailed mechanisms whereby cells utilize certain integral membrane proteins to perceive their surrounding environment and interact with it With timely presentations and stimulating discussions this Symposium addressed the genetics and biochemistry of adhesion molecules the regulation of their functions and their role in cancer and the immune system Emphasis was given to adhesion proteins in the integrin family because of the widespread distribution of this group of molecules and its important role in essentially all eukaryotic biological systems The regulation of integrin genes and their expression are discussed in detail as are specific aspects of the genetics of fibronectin The molecular basis for the regulation of certain integrins the function of these proteins in determining cell adhesion and the consequences of this adhesion for the function of the cells involved are discussed The role of certain integrins in stimulating signal transduction the essential involvement of integrins in conditioning the function of T and NK cells function the heterogeneity of integrins and its biological consequences and the role of cell adhesion molecules in tumor cells invasion and metastases are all extensively analyzed New information was presented on the role of CD44 and splice variants in normal differentiation and tumor progression

Cell Adhesion D.R. Colman, 1997-02-24 One prerequisite for the evolution of multicellular organisms was the invention of mechanisms by which cells could adhere to one another At some point in our history dividing cells no longer went their separate protozoic ways in the primordial oceans but instead found that by maintaining an association by sticking together but not fusing numerous evolutionary advantages became possible The subsequent development of specialized tissues and organs depended on the elaboration of incredibly sophisticated regulatable cell to cell adhesion mechanisms which are known to operate in biological processes as diverse as the growth of the embryo the immune response the establishment of connections between nerve cells and arteriosclerosis to name just a few Although we can only guess at the ancestral mechanisms that fostered the first primitive intercellular unions some one billion years ago we now recognize contemporary molecular themes with presumably ancient origins that mediate cell cell interactions The chapters in this book serve as useful thought provoking but not exhaustive commentaries on contemporary topics within the broad field of cell adhesion If the reader detects a slight tilt toward those adhesion molecules that function in the nervous system this is merely a reflection of this editor s interests biases and of course limitations
