Composite Interfaces:

Molecular Characterization of Composite Interfaces Hatsuo Ishida, Ganesh Kumar, 2013-11-11 This book is an extended version of the proceedings of the Symposium on Polymer Composites Interfaces which was held under the auspices of the Division of Polymer Chemistry American Chemical Society ACS during the annual ACS meeting in Seattle March 1983 The importance of the interface in composite materials has been recognized since the inception of modern composite technology Specifically silane coupling agents were developed for glass fiber reinforced composites at a very early date Ever since then the diversity of composite materials and the development of various surface treatment methods have led to the establishment of an interface art A trial and error approach has dominated the interfacial aspects of composite technology until very recently With the advent of modern analytical techniques for surface characterization it became possible to study detailed surface and interface structures It was hoped that this symposium would catalyze such a fundamental and scientific approach in composite studies For this reason the symposium was structured to verify the influence of interfacial structures on the mechanical and physical performance of composites and to improve our knowledge of the microstructure of composite interfaces As the word composite indicates interdisciplinary interaction is indispensable for proper understanding of

multiphase systems

Engineered Interfaces in Fiber Reinforced Composites Jang-Kyo Kim, Yiu-Wing Mai, 1998-10-21 The study and application of composite materials are a truly interdisciplinary endeavour that has been enriched by contributions from chemistry physics materials science mechanics and manufacturing engineering The understanding of the interface or interphase in composites is the central point of this interdisciplinary effort From the early development of composite materials of various nature the optimization of the interface has been of major importance While there are many reference books available on composite materials few of them deal specifically with the science and mechanics of the interface of fiber reinforced composites Further many recent advances devoted solely to research in composite interfaces have been scattered in a variety of published literature and have yet to be assembled in a readily accessible form To this end this book is an attempt to bring together recent developments in the field both from the materials science and mechanics perspective in a single convenient volume The central theme of the book is tailoring the interface properties to optimise the mechanical performance and structural integrity of composites with enhanced strength stiffness and fracture toughness or specific fracture resistance It deals mainly with interfaces in advanced composites made from high performance fibers such as glass carbon aramid ultra high modulus polyethylene and some inorganic e.g. B₄C, SiC fibers and matrix materials encompassing polymers metals alloys and ceramics The book is intended to provide a comprehensive treatment of composite interfaces in such a way that it should be of interest to materials scientists technologists and practising engineers as well as graduate students and their supervisors in advanced composites We hope that this book will also serve as a valuable source of reference to all those involved in the design and research of composite interfaces The book contains eight chapters of

discussions on microstructure property relationships with underlying fundamental mechanics principles In Chapter 1 an introduction is given to the nature and definition of interfaces in fiber reinforced composites Chapter 2 is devoted to the mechanisms of adhesion which are specific to each fiber matrix system and the physio chemical characterization of the interface with regard to the origin of adhesion The experimental techniques that have been developed to assess the fiber matrix interface bond quality on a microscopic scale are presented in Chapter 3 along with the techniques of measuring interlaminar intralaminar strengths and fracture toughness using bulk composite laminates The applicability and limitations associated with loading geometry and interpretation of test data are compared Chapter 4 presents comprehensive theoretical analyses based on shear lag models of the single fiber composite tests with particular interest being placed on the interface debond process and the nature of the fiber matrix interfacial bonding Chapter 5 is devoted to reviewing current techniques of fiber surface treatments which have been devised to improve the bond strength and the fiber matrix compatibility stability during the manufacturing processes of composites The micro failure mechanisms and their associated theories of fracture toughness of composites are discussed in Chapter 6 The roles of the interface and its effects on the mechanical performance of fiber composites are addressed from several viewpoints Recent research efforts to augment the transverse and interlaminar fracture toughness by means of controlled interfaces are presented in Chapters 7 and 8

Interface Science and Composites Soo-Jin Park, Min-Kang Seo, 2011-07-18 The goal of Interface Science and Composites is to facilitate the manufacture of technological materials with optimized properties on the basis of a comprehensive understanding of the molecular structure of interfaces and their resulting influence on composite materials processes From the early development of composites of various natures the optimization of the interface has been of major importance While there are many reference books available on composites few deal specifically with the science and mechanics of the interface of materials and composites Further many recent advances in composite interfaces are scattered across the literature and are here assembled in a readily accessible form bringing together recent developments in the field both from the materials science and mechanics perspective in a single convenient volume The central theme of the book is tailoring the interface science of composites to optimize the basic physical principles rather than on the use of materials and the mechanical performance and structural integrity of composites with enhanced strength stiffness and fracture toughness or specific fracture resistance It also deals mainly with interfaces in advanced composites made from high performance fibers such as glass carbon aramid and some inorganic fibers and matrix materials encompassing polymers carbon metals alloys and ceramics Includes chapter on the development of a nanolevel dispersion of graphene particles in a polymer matrix Focus on tailoring the interface science of composites to optimize the basic physical principles Covers mainly interfaces in advanced composites made from high performance fibers

Interface Engineering of Natural Fibre Composites for Maximum Performance Nikolaos E

Zafeiropoulos,2011-02-26 One of the major reasons for composite failure is a breakdown of the bond between the reinforcement fibres and the matrix When this happens the composite loses strength and fails By engineering the interface between the natural fibres and the matrix the properties of the composite can be manipulated to give maximum performance Interface engineering of natural fibre composites for maximum performance looks at natural sustainable fibre composites and the growing trend towards their use as reinforcements in composites Part one focuses on processing and surface treatments to engineer the interface in natural fibre composites and looks in detail at modifying cellulose fibre surfaces in the manufacture of natural fibre composites interface tuning through matrix modification and preparation of cellulose nanocomposites It also looks at the characterisation of fibre surface treatments by infrared and raman spectroscopy and the effects of processing and surface treatment on the interfacial adhesion and mechanical properties of natural fibre composites Testing interfacial properties in natural fibre composites is the topic of part two which discusses the electrochemical characterisation of the interfacial properties of natural fibres assesses the mechanical and thermochemical properties and moisture uptake behaviour of natural fibres and studies the fatigue and delamination of natural fibre composites before finishing with a look at Raman spectroscopy and x ray scattering for assessing the interface in natural fibre composites With its distinguished editor and international team of contributors Interface engineering of natural fibre composites for maximum performance is an invaluable resource to composite manufacturers and developers materials scientists and engineers and anyone involved in designing and formulating composites or in industries that use natural fibre composites Examines characterisation of fibre surface treatments by infrared and raman spectroscopy and the effects of processing and surface treatment Reviews testing interfacial properties in natural fibre composites including the electrochemical characterisation of the interfacial properties of natural fibres Assesses the mechanical and thermochemical properties and moisture uptake behaviour of natural fibres and studies the fatigue and delamination of natural fibre composites

on Mechanical Properties Arthur B. Clark, ASTRO RESEARCH CORP CARPINTERIA CA., 1967 Interfaces in metal matrix composites reinforced with high modulus filaments were studied in order to obtain an increased understanding of the effects of interface type on the mechanical properties of various composite systems A search of the published literature and subsequent investigations in stress field characterization and fracture mechanics led to the adoption of a modified Mohr Coulomb hypothesis for the prediction of interface failure To verify the hypothesis an experimental program was conducted utilizing a traction torsion test composite of special design which incorporated an interface between vacuum deposited aluminum and chemical vapor deposited boron Other experimental work was performed on vacuum deposited aluminum and titanium matrix composites reinforced with boron and silicon carbide filaments with the object of characterizing interface bonds developed under various conditions of thermal treatment Several methods were employed including conventional optical metallographic techniques electron microscope inspection X ray diffraction camera studies electron beam microprobe analysis and mechanical testing In addition a differential scanning calorimeter technique was evaluated to determine the suitability of this method to the detection of interface reactions Author Interfacial Effects in Particulate, Fibrous and Layered Composite Materials T.W. Clyne, 1995-12-04 There is extensive interest in the development of new and improved composite materials This is particularly true of composite systems based upon metallic and ceramic constituents As the characteristics of the interface are of central importance there is a great incentive for an improved understanding of the nature of interfaces between constituents in such composite systems and of the factors that affect their mechanical characteristics **Interfaces in Polymer Matrix Composites** Edwin P.
