## **Constraint Logic Programming Selected Research Logic Programming:**

**Constraint Logic Programming** Frédéric Benhamou, Alain Colmerauer, 1993 Constraint logic programming the notion of computing with partial information is becoming recognized as a way of dramatically improving on the current generation of programming languages This collection presents the best of current work on all aspects of constraint logic programming languages from theory through language implementation Beginning in the mid 1980s constraint logic programming became a powerful and essential theoretical concept whose first practical application was the development of efficient programming languages based on Prolog Benhamou and Colmerauer have taken care to illustrate the strong links between current research and existing CLP languages The first part of the book focuses on significant theoretical studies that propose general models for constraint programming and the two following parts develop current ideas on themes derived from these languages numerical constraints Booleans and other finite domains The concluding part on CLP language design gathers work on original constraints and on top level implementation Frédéric Benhamou is a Researcher in the Computer Science Department of the Facult des Sciences de Luminy at the University of Marseilles where Alain Colmerauer is Professor of Computer Science

**Recent Advances in Constraints** Krzysztof R. Apt, Francois Fages, Francesca Rossi, Peter Szeredi, Josef Vánca, 2004-03-26 Constraint programming is the fruit of several decades of research carried out in mathematical logic automated deduction operations research and artificial intelligence The tools and programming languages arising from this research have enjoyed real success in the industrial world as they contribute to solving hard combinatorial problems in diverse domains such as production planning communication networks robotics and bioinformatics This volume contains the extended and reviewed versions of a selection of papers presented at the Joint ERCIM CoLogNET International Workshop on Constraint Solving and Constraint Logic Programming CSCLP2003 which was held from June 30 to July 2 2003 The venue chosen for the seventh edition of this annual workshop was the Computer and Automation Research Institute of the Hungarian Academy of Sciences MTA SZTAKI in Budapest Hungary This institute is one of the 20 members of the Working Group on Constraints of the European Research Consortium for Informatics and Mathematics ERCIM For many participants this workshop provided the first opportunity to visit their ERCIM partner in Budapest CoLogNET is the European funded network of excellence dedicated to supporting and enhancing cooperation and research on all areas of computational logic and continues the work done previously by the Compulog Net In particular the aim of the logic and constraint logic programming area of CoLogNET is to foster and support all research activities related to logic programming and constraint logic programming The editors would like to take the opportunity and thank all the authors who submitted papers to this volume as well as the reviewers for their helpful work

**Logic Programming** John Lloyd, 1995 The International Logic Programming Symposium is one of two major international conferences sponsored by the Association of Logic Programming Both conferences are held annually The theme for the 1995 conference was Declarative Systems particularly the integration

of the logic programming functional programming and object oriented programming paradigms

**Handbook of Constraint Programming** Francesca Rossi, Peter van Beek, Toby Walsh, 2006-08-18 Constraint programming is a powerful paradigm for solving combinatorial search problems that draws on a wide range of techniques from artificial intelligence computer science databases programming languages and operations research Constraint programming is currently applied with success to many domains such as scheduling planning vehicle routing configuration networks and bioinformatics The aim of this handbook is to capture the full breadth and depth of the constraint programming field and to be encyclopedic in its scope and coverage While there are several excellent books on constraint programming such books necessarily focus on the main notions and techniques and cannot cover also extensions applications and languages The handbook gives a reasonably complete coverage of all these lines of work based on constraint programming so that a reader can have a rather precise idea of the whole field and its potential Of course each line of work is dealt with in a survey like style where some details may be neglected in favor of coverage However the extensive bibliography of each chapter will help the interested readers to find suitable sources for the missing details Each chapter of the handbook is intended to be a self contained survey of a topic and is written by one or more authors who are leading researchers in the area The intended audience of the handbook is researchers graduate students higher year undergraduates and practitioners who wish to learn about the state of the art in constraint programming No prior knowledge about the field is necessary to be able to read the chapters and gather useful knowledge Researchers from other fields should find in this handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work thus providing a means for a fruitful cross fertilization among different research areas The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications

programming language Prolog The unique features of logic programming make it appealing for numerous applications in artificial intelligence computer aided design and verification databases and operations research and for exploring parallel and concurrent computing The last two decades have witnessed substantial developments in this field from its foundation to implementation applications and the exploration of new language designs Topics covered Theoretical Foundations Higher Order Logics Non Monotonic Reasoning Programming Methodology Programming Environments Extensions to Logic Programming Constraint Satisfaction Meta Programming Language Design and Constructs Implementation of Logic Programming Languages Compilation Techniques Architectures Parallelism Reasoning about Programs Deductive Databases Applications Logic Programming series Research Reports and Notes

**Parallel and Constraint Logic Programming** Ioannis Vlahavas, Panagiotis Tsarchopoulos, Ilias Sakellariou, 2012-12-06  
Constraint Logic Programming CLP an area of extreme research interest in recent years extends the semantics of Prolog in such a way that the combinatorial explosion a characteristic of most problems in the field of Artificial Intelligence can be tackled efficiently By employing solvers dedicated to each domain instead of the unification algorithm CLP drastically reduces the search space of the problem which leads to increased efficiency in the execution of logic programs CLP offers the possibility of solving complex combinatorial problems in an efficient way and at the same time maintains the advantages offered by the declarativeness of logic programming The aim of this book is to present parallel and constraint logic programming offering a basic understanding of the two fields to the reader new to the area The first part of the book gives an introduction to the fundamental aspects of conventional logic programming which is necessary for understanding the parts that follow The second part includes an introduction to parallel logic programming architectures and implementations proposed in the area Finally the third part presents the principles of constraint logic programming The last two parts also include descriptions of the supporting facilities for the two paradigms in two popular systems ECLIPSe and SICStus These platforms have been selected mainly because they offer both parallel and constraint features Annotated and explained examples are also included in the relevant parts offering a valuable guide and a first practical experience to the reader Finally applications of the covered paradigms are presented The authors felt that a book of this kind should provide some theoretical background necessary for the understanding of the covered logic programming paradigms and a quick start for the reader interested in writing parallel and constraint logic programming programs However it is outside the scope of this book to provide a deep theoretical background of the two areas In that sense this book is addressed to a public interested in obtaining a knowledge of the domain without spending the time and effort to understand the extensive theoretical work done in the field namely postgraduate and advanced undergraduate students in the area of logic programming This book fills a gap in the current bibliography since there is no comprehensive book of this level that covers the areas of conventional parallel

and constraint logic programming Parallel and Constraint Logic Programming An Introduction to Logic Parallelism and Constraints is appropriate for an advanced level course on Logic Programming or Constraints and as a reference for practitioners and researchers in industry

**Computer Science Handbook** Allen B. Tucker,2004-06-28 When you think about how far and fast computer science has progressed in recent years it s not hard to conclude that a seven year old handbook may fall a little short of the kind of reference today s computer scientists software engineers and IT professionals need With a broadened scope more emphasis on applied computing and more than 70 chap
