Propongo

Imagina que en una isla remota se descubre un extraño animal. Escribe un reporte al respecto desde el punto de vista de un taxónomo y otro desde el punto de vista de un biólogo sistemático.

Portada del *Systema Naturae*. Esta publicación fue el punto de partida de la nomenclatura zoológica, que es la parte de la sistemática que se encarga de asignar los nombres a los diversos grupos animales. También existe un sistema de nomenclatura para las plantas, los hongos, las bacterias y otros grupos de organismos.

1. Sistemática y taxonomía

Ampliar información

La sistemática es la ciencia que estudia la historia evolutiva de los seres vivos y sus relaciones de parentesco. Por ejemplo, en un estudio sobre la diversidad de abejas desde la sistemática, un biólogo podría llegar a consultar aspectos como: cuáles son las especies que conforman el grupo, cuáles están más relacionadas o emparentadas, cuáles de las especies son más antiguas y cuáles surgieron recientemente, entre otros aspectos. Para que la sistemática pueda cumplir con su objetivo de establecer la historia evolutiva de las especies se apoya en una ciencia más antigua, la taxonomía que se dedica a describir grupos de seres vivos, nombrarlos y clasificarlos. Así, un taxónomo para el estudio de la diversidad de abejas obtendrá el nombre de cada especie, la descripción, la diagnosis, que es el conjunto de caracteres por medio de los cuales se puede identificar al grupo fácilmente, y la distribución geográfica.

1.1 Origen de los sistemas de clasificación

Buscar información

El primer sistema de clasificación conocido se remonta al año 300 a. C., cuando el griego Aristóteles dividió a los seres vivos en plantas y animales. A estos últimos los clasificó, a su vez, de acuerdo con la presencia o ausencia de sangre, y otras características, como su locomoción, forma de reproducción y anatomía externa.

Hacia mediados del siglo XVI, y estimulados por la exploración de ultramar, los naturalistas crearon los primeros jardines botánicos, herbarios y museos de historia natural. El Nuevo Mundo era particularmente llamativo para la exploración científica, por lo que se hicieron muchas expediciones que llevaron a Europa gran cantidad de descripciones y especímenes de plantas y animales antes desconocidos. Los naturalistas se dedicaron a estudiarlos, a comparar sus estructuras con las formas conocidas, y si se trataba de un nuevo espécimen, lo nombraban y lo organizaban de diversas maneras dependiendo del cuidado que este necesitara.

En el siglo XVIII, el botánico sueco Carl von Linné o Linnéo fue quien sentó las bases del sistema moderno de clasificación. Primero, introdujo el sistema jerárquico de clasificación, que consistía de un conjunto de categorías que ordenadamente incluían a otras. Linnéo agrupaba a los organismos en sus categorías de acuerdo con su similitud morfológica. Posteriormente, Linnéo creó la nomenclatura binomial, con lo que estableció las reglas para nombrar a las especies. Un nombre específico incluye dos partes, por ejemplo, los humanos nos denominamos *Homo sapiens*; el primer nombre se refiere al género que es la categoría inmediatamente superior a la especie en el sistema jerárquico de clasificación, y el segundo, se refiere al epíteto específico, un nombre que hace referencia a la persona que lo descubrió o al lugar donde se encontró, entre otros aspectos.

A pesar de ser un creacionista, Linnéo involuntariamente reflejó en su sistema de clasificación los parentescos evolutivos de muchos organismos. Lo igualmente la taxonomía, y los científicos vieron la necesidad de que la clasificación de los seres vivos reflejara su parentesco evolutivo.

38 | Acción de pensamiento: explico la importancia de la sistemática y la taxonomía en el estudio de los seres vivos.
