Creative Glab Blowing:

Neurobiology of the Axon in Health and Disease Maren Engelhardt, Vann Bennett, 2019-11-04 Ever since Santiago Ramon y Cajal sketched his captivating panels of the microscopic structure of the brain with its vast diversity of neuronal morphology over a century ago scientists have been drawn to this seemingly chaotic network of neurites and processes to uncover how structure relates to function During the course of a century we have moved from merely describing neuronal and glial morphology to furthering our understanding of such intricate processes as organelle and factor transport cellular compartmentalization neuronal polarity cytoskeleton dynamics neurite pathfinding and the impact of pathophysiological insult on these structures and events Yet to this day and likely for the foreseeable future much work remains to be done to fully grasp the exceptional role of neurites for the function of larger neuronal ensembles and networks While the somatodendritic domain of neurons has been in the focus of attention for many years mostly because of its great dynamic remodeling capacity during events of plasticity e.g. learning the axonal domain has somehow remained in the background despite the fact that especially recent comprehensive studies from various fields of research underline the axon's contribution to dynamic plasticity processes Consequently this Research Topic focuses on the many exciting aspects of axonal neurobiology ranging from membrane composition and molecular determination during development to axonal domain specialization and physiology in health and disease

In Chapter 1 Axons in the PNS Bombeiro et al use immunodeficient mice to study the role of lymphocytes during the regeneration of peripheral nerves showing that the modulation of immune responses after injury can be an efficient approach to enhance nerve regeneration in the PNS Using a DRG model Berbusse et al identify the onset of damage to mitochondrial structure and dynamics as a key event during early axon degeneration and provide evidence that Nmnat1 a member of the family of nicotinamide nucleotide adenylyltransferases can have protective effects by preserving normal mitochondrial integrity and dynamics In another study of PNS nerve regeneration Law et al use proteomics approaches via Mass Spectrometry to provide evidence that rosovitine a synthetic purine nucleoside analog can successfully promote PNS axon regeneration

In Chapter 2 Axonal development in the central nervous system Yoshimura et al analyze specialized axonal domains namely the axon initial segment and nodes of Ranvier with regards to their expression profiles of the major scaffolding protein IV spectrin Super resolution microscopy reveals a potential developmental switch of spectrin isoforms at both axonal domains In a related study also using super resolution microscopy Leterrier et al examine a potential reciprocal role of membrane partners in ankyrin G targeting and stabilization at the axonal membrane during development The authors demonstrate a tight and precocious association of ankyrin G with its membrane partners Hfflin et al address the question of axon initial segment morphology across different cell classes in cortical organotypic slice cultures and find a surprising heterogeneity especially between pyramidal cells and interneurons in primary visual cortex In a major step towards establishing a successful live label of the axon initial segment Dumitrescu et al report the development of a

genetically encoded construct consisting of a voltage gated sodium channel intracellular domain fused to yellow fluorescent protein YFP NaVII III Nelson and Jenkins then provide a comprehensive Review article on the axon initial segment and nodes of Ranvier with a special focus on the various scaffolding protein isoforms and their role in human disease In Chapter 3 Axonal physiology and plasticity Nikitin et al investigate fast onset dynamics of action potentials during neuronal development in vitro showing that encoding of high frequencies improves upon culture maturation accompanied by the development of passive electrophysiological properties and action potential generation Using pharmacological and RNA interference approaches Tapia et al provide evidence that cannabinoid receptors and their ligands can modulate dendritic morphology and thus indirectly also affect ankyrin G accumulation at the axon initial segment A Mini Review by Zbili et al discusses the potential impact of subthreshold changes in presynaptic membrane potential before action potential initiation on neurotransmitter release and which significant impact such mechanisms could have on information processing in neuronal circuits Yamada and Kuba close this chapter with a Mini Review on axon initial segment plasticity with a particular focus on ion channels and the biophysics of excitability In Chapter 4 Axon degeneration and regeneration Hamada et al investigate the often overlooked question to which extent myelin loss affects action potential propagation along distal branch points and axon collaterals Using the cuprizone demyelination model and optical voltage sensitive dye imaging the authors uncover functional consequences of demyelination that reach well beyond the main axon In a model of mild traumatic brain injury Vascak et al demonstrate complex aspects of this injury type on neocortical circuit function including changes in inhibitory perisomatic input and axon initial segment driven output in affected layer V neurons In a Mini Review Grosch et al discuss recent advances in the field of Parkinson s disease with a focus on early degeneration in dopaminergic and serotonergic neurons of the basal ganglia The last two articles cover the topic of axonal regeneration Li et al investigate the role of activated astrocytes in spinal cord lesion and how their functional downregulation via an inhibitor of mitochondrial fission Mdivi 1 could potentially have positive impact on lesion scar formation and axonal regeneration In a final Review Liu et al highlight recent advances in the development of biomaterial scaffolds and cell transplantation strategies to combine two promising therapeutic approaches for spinal cord injury
