Reflections on a Career Alexandra Bradshaw, 2014-11-26 Problem solving consists of using generic or ad hoc methods in an orderly manner for finding solutions to problems Some of the problem solving techniques developed and used in artificial intelligence computer science engineering mathematics medicine etc are related to mental problem solving techniques studied in psychology The term problem solving is used in many disciplines sometimes with different perspectives and often with different terminologies For instance it is a mental process in psychology and a computerized process in computer science Problems can also be classified into two different types ill defined and well defined from which appropriate solutions are to be made Ill defined problems are those that do not have clear goals solution paths or expected solution Well defined problems have specific goals clearly defined solution paths and clear expected solutions These problems also allow for more initial planning than ill defined problems Being able to solve problems sometimes involves dealing with pragmatics logic and semantics interpretation of the problem The ability to understand what the goal of the problem is and what rules could be applied represent the key to solving the problem Sometimes the problem requires some abstract thinking and coming up with a creative solution
