*Creep of Materials and Structures* T. H. Hyde, 1994-03-23 The latest materials modeling and analysis to avoid high temperature failure Creep of Materials and Structures details the latest knowledge surrounding creep phenomena and material failure at elevated temperatures Originally published as a special edition of the Journal of Strain Analysis for Engineering Design this review presents essential information regarding safe design procedures advances in materials science material behavior modeling stress analysis and more Staying abreast of the latest findings is critical when safety is at stake and this review offers a single volume reference for the latest knowledge in the field **Creep and Damage in Materials and Structures** Holm Altenbach, Jacek J. Skrzypek, 2014-05-04 This textbook gives a concise survey of constitutive and structural modeling for high temperature creep damage low cycle fatigue and other inelastic conditions The book shows the creep and continuum damage mechanics as rapidly developing discipline which interlinks the material science foundations the constitutive modeling and computer simulation application to analysis and design of simple engineering components It is addressed to young researchers and scientists working in the field of mechanics of inelastic time dependent materials and structures as well as to PhD students in computational mechanics material sciences mechanical and civil engineering Creep and Fracture of Engineering Materials and Structures T. Cocks, A.R.S. Pontern, 2012-12-06 Failure of components which operate in the creep range can result

either from the growth of a dominant crack or through the accumulation of damage in the material. Conventional and nuclear power generating plants are generally designed on the basis of continuum failure with assessment routes providing an indication of the effects of flaws on component performance. Another example where an understanding of creep failure is important is in the design of offshore structures which operate in arctic waters. These structures can be subjected to quite considerable forces by wind driven ice sheets which are limited by failure of the ice sheet. Design codes are currently being developed which identify the different mechanisms of failure ranging from continuum crushing to radial cracking and buckling of the ice sheet. Our final example concerns engineering ceramics which are currently being considered for use in a wide range of high temperature applications. A major problem preventing an early adoption of these materials is their brittle response at high stresses although they can behave in a ductile manner at lower stresses. In each of the above situations an understanding of the processes of fast fracture, creep crack growth and continuum failure is required and in particular an understanding of the material and structural features that influence the transition from brittle to ductile behaviour. The translation of this information to component design is most advanced for metallic components.
