Climatology is closely related to geography because in geography, climate is studied as a part of the physical environment of man and like geography, the combined nature of various elements is kept in view in the description of events.

Climatology is described as the scientific study of the behavior of the thin gaseous layer surrounding the earth's surface i.e. the atmosphere. In fact, climatology is a holistic science which incorporates data, ideas and theories. Climatology is the science that describes the nature of climate at different places on the earth and explains the reasons for its variations. It also includes the study of the effects of climatic variations on other elements of the environment and human activities.

The primary goal of climatology is to study the unique characteristics of atmosphere in controlling the global climate, origin and types of climate, causes and processes influencing the climate variations, elements of weather and the impact of climate on human beings or vice-versa.

In fact, climatology is the study and description related to various types of climatic conditions of the earth's surface.

Climatology is closely interlinked between Physical Geography, Agronomy, Aerology and Meteorology.
