---

An algorithm for solving the problem

$$\text{minimize } \|A^T x - b\|_1,$$

subject to optional constraints of the form

$$G^T x = h, \quad C^T x \geq d,$$

is given, together with an implementation in Fortran. The algorithm generalizes one given earlier by the same authors for the unconstrained  $l_1$  problem.

**Key Words and Phrases:**  $l_1$  norm, data fitting, discrete approximation, linearly constrained approximation

**CR Categories:** 5.13, 5.41

## 1. MOTIVATION, BACKGROUND, AND NOTATION

Recently Armstrong and Hultz [1] published a report on an algorithm for the problem

$$\text{minimize } \|A^T x - b\|_1,$$

$$\text{subject to } l \leq C^T x \leq u.$$

Their algorithm is based upon a linear-programming formulation of this problem and is developed as a version of the simplex method, which takes advantage of the problem's special structure.

We present here an approach to solving a class of problems that includes the problem given above as a special case. The proposed algorithm is an extension of the one we have described in [3]. It minimizes an  $l_1$  norm subject to any mixture (possibly even a vacuous one) of linear equality and inequality constraints. It distinguishes itself from simplex techniques in that it does not require a feasible (or even a basic) point to begin. Furthermore, it can take more general steps in approaching a solution than those from "vertex" to "adjacent vertex" which

Bochev,Max D. Gunzburger,2009-04-28 Since their emergence in the early 1950s nite element methods have become one of the most versatile and powerful methodologies for the approximate numerical solution of partial differential equations At the time of their inception nite e ment methods were viewed primarily as a tool for solving problems in structural analysis However it did not take long to discover that nite element methods could be applied with equal success to problems in other engineering and scienti c elds Today nite element methods are also in common use and indeed are often the method of choice for incompressible uid ow heat transfer electromagnetics and advection diffusion reaction problems just to name a few Given the early conn tion between nite element methods and problems engendered by energy minimi tion principles it is not surprising that the rst mathematical analyses of nite e ment methods were given in the environment of the classical Rayleigh Ritz setting Yet again using the fertile soil provided by functional analysis in Hilbert spaces it did not take long for the rigorous analysis of nite element methods to be extended to many other settings Today nite element methods are unsurpassed with respect to their level of theoretical maturity **Nonlinear Control Systems Design 1989** A. Isidori,2014-05-23 In the last two decades the development of specific methodologies for the control of systems described by nonlinear mathematical models has attracted an ever increasing interest New breakthroughs have occurred which have aided the design of nonlinear control systems However there are still limitations which must be understood some of which were addressed at the IFAC Symposium in Capri The emphasis was on the methodological developments although a number of the papers were concerned with the presentation of applications of nonlinear design philosophies to actual control problems in chemical electrical and mechanical engineering Design Methods of Control Systems D. **Saturated Control of Linear Systems** Abdellah Benzaouia,Fouad Mesquine,Mohamed Benhayoun,2017-09-20 This book deals with a combination of two main problems for the first time They are saturation on control and on the rate or increment of the control and the solution of unsymmetrical saturation on the control by LMIs It treats linear systems in state space form in both the continuous and discrete time domains Necessary and sufficient conditions are derived for autonomous linear systems with constrained state increment or rate such that the system evolves respecting incremental or rate constraints if any A pole assignment technique is then used to solve the problem giving stabilizing state feedback controllers

that respect non symmetrical constraints on control alone or on both control and its increment or rate Illustrative examples show the application of these methods on academic examples or on such real plant models as the double integrator system This problem is then extended to various others including systems with constraints and perturbations singular systems with constrained control systems with unsymmetrical saturations saturated systems with delay and 2 D systems with saturations The solutions obtained are of two types necessary and sufficient conditions solved with linear programming techniques and sufficient conditions under LMIs A new approach extends existing techniques for dealing with symmetrical saturations to take direct account of unsymmetrical saturations into account with LMIs This tool enables the authors to obtain new results on continuous and discrete time systems The book uses illustrative examples and figures and provides many comparisons with existing results Systems theoreticians interested in multidimensional systems and practitioners working with saturated and constrained controllers will find the research and background presented in Saturated Control of Linear Systems to be of considerable interest in helping them overcome problems with their plant and in stimulating further research
