Laboratory Phonology 7 Carlos Gussenhoven, Natasha Warner, 2008-08-22 This collection of recent papers in Laboratory Phonology approaches phonological theory from several different empirical directions Psycholinguistic research into the perception and production of speech has produced results that challenge current conceptions about phonological structure Field work studies provide fresh insights into the structure of phonological features and the phonology phonetics interface is investigated in phonetic research involving both segments and prosody while the role of underspecification is put to the test in automatic speech recognition

The Role of Working Memory and Executive Function in Communication under Adverse Conditions Mary Rudner, Carine Signoret, 2016-06-20 Communication is vital for social participation However communication often takes place under suboptimal conditions This makes communication harder and less reliable leading at worst to social isolation In order to promote participation it is necessary to understand the mechanisms underlying communication in different situations Human communication is often speech based either oral or written but may also involve gesture either accompanying speech or in the form of sign language For communication to be achieved a signal generated by one person has to be perceived by another person attended to comprehended and responded to This process may be hindered by adverse conditions including factors that may be internal to the sender e.g incomplete or idiosyncratic language production occur

during transmission e.g. background noise or signal processing or be internal to the receiver e.g. poor grasp of the language or sensory impairment. The extent to which these factors interact to generate adverse conditions may differ across the lifespan. Recent work has shown that successful speech communication under adverse conditions is associated with good cognitive capacity including efficient working memory and executive abilities such as updating and inhibition. Further, frontoparietal networks associated with working memory and executive function have been shown to be activated to a greater degree when it is harder to achieve speech comprehension. To date, less work has focused on sign language communication under adverse conditions or the role of gestures accompanying speech communication under adverse conditions. It has been proposed that the role of working memory in communication under such conditions is to keep fragments of an incomplete signal in mind, updating them as appropriate and inhibiting irrelevant information until an adequate match can be achieved with lexical and semantic representations held in long-term memory. Recent models of working memory highlight an episodic buffer whose role is the multimodal integration of information from the senses and long-term memory. It is likely that the episodic buffer plays a key role in communication under adverse conditions. The aim of this research topic is to draw together multiple perspectives on communication under adverse conditions, including empirical and theoretical approaches. This will facilitate a scientific exchange among individual scientists and groups studying different aspects of communication under adverse conditions and/or the role of cognition in communication. As such, this topic belongs firmly within the field of Cognitive Hearing Science. Exchange of ideas among scientists with different perspectives on these issues will allow researchers to identify and highlight the way in which different internal and external factors interact to make communication in different modalities more or less successful across the lifespan. Such exchange is the forerunner of broader dissemination of results which ultimately may make it possible to take measures to reduce adverse conditions, thus facilitating communication. Such measures might be implemented in relation to the built environment, the design of hearing aids and public awareness.

Neural and Behavioral Mechanisms of Clear Speech Jenna Silver Luque,2017 Clear speech is a speaking style that has been shown to improve intelligibility in adverse listening conditions for various listener and talker populations Clear speech phonetic enhancements include a slowed speech rate expanded vowel space and expanded pitch range Although clear speech phonetic enhancements have been demonstrated across a variety of talkers only a subset of these changes may be required for listeners to benefit perceptually from clear speech Furthermore while current literature has provided some understanding of the phonetic enhancements that are typical of clear speech and the improvements in intelligibility resulting from its use less is understood regarding how listeners benefit from clear speech Understanding the mechanisms underlying the effectiveness of clear speech will provide insight into speech processing more generally To that end two studies were conducted to investigate the possible mechanisms underlying clear speech benefits The first study tests the hypothesis that clear speech reduces the amount of information needed for syllable identification The amount of information presented to listeners was controlled using a silent center syllable paradigm in which various amounts of the center or edge of the syllables were removed The second study tests the hypothesis that phonetic processing of clear speech requires fewer neuro cognitive resources than typical or conversational speech An Event Related Potential ERP paradigm focused on the Phonological Mismatch Negativity PMN component was used to compare participants neurophysiological responses to conversational and clear speech stimuli Results from the first experiment supported the hypothesis of a clear speech benefit in partial syllables although the effect was stronger for some vowels than for others The second experiment demonstrated differences in the way the brain responds to clear versus conversational speech for syllables in which only the nucleus varied across stimuli Match mismatch differences were found in the MMN and PMN components while the N600 component was found to respond to style differences
