**Natural Resistance Mechanisms of Plants to Viruses** Gad Loebenstein,John Peter Carr,2007-05-26 Over the course of evolution most plants have acquired the ability to defend themselves against most groups of pathogens including the viruses Many antiviral resistance phenomena have been known and studied for decades but until recently understanding of their underlying mechanisms has lagged behind These phenomena include resistance to infection resistance to virus translocation through the plant recovery from infection and genetically defined resistance together with the associated

phenomena of the local lesion response and induced or acquired resistance The identification and cloning of plant resistance genes characterization of downstream signaling components and especially the explosion of data regarding gene silencing mechanisms has led to rapid progress in the investigation of natural resistance phenomena Meanwhile in plant virology there has been remarkable progress in the arenas of replication movement proteins and plasmodesmatal gating and in the discovery of gene silencing suppressors Therefore it seemed timely and appropriate to link older but still important data on the well known classical resistance phenomena with the new information that has emerged during the last decade or so We hope that this book will inspire further research in this area as resistance presents the most economical and environmentally sound approach to control plant virus diseases Future technologies that emerge from this research might include an improved ability to introduce resistance genes into virus susceptible agronomically important cultivars to improve current pathogen derived resistance strategies using our new knowledge of small interfering and microRNAs or to develop targeted chemical treatments
