*Artificial Intelligence in Education, 1997* Ben Du Boulay, Riichiro Mizoguchi, 1997

*Explainable Human-AI Interaction* Sarath Sreedharan, Anagha Kulkarni, Subbarao Kambhampati, 2022-01-24 From its inception artificial intelligence AI has had a rather ambivalent relationship with humans swinging between their augmentation and replacement Now as AI technologies enter our everyday lives at an ever increasing pace there is a greater need for AI systems to work synergistically with humans One critical requirement for such synergistic human AI interaction is that the AI systems behavior be explainable to the humans in the loop To do this effectively AI agents need to go beyond planning with their own models of the world and take into account the mental model of the human in the loop At a minimum AI agents need approximations of the human s task and goal models as well as the human s model of the

AI agent's task and goal models. The former will guide the agent to anticipate and manage the needs, desires, and attention of the humans in the loop, and the latter allow it to act in ways that are interpretable to humans by conforming to their mental models of it and be ready to provide customized explanations when needed. The authors draw from several years of research in their lab to discuss how an AI agent can use these mental models to either conform to human expectations or change those expectations through explanatory communication. While the focus of the book is on cooperative scenarios, it also covers how the same mental models can be used for obfuscation and deception. The book also describes several real-world application systems for collaborative decision making that are based on the framework and techniques developed here. Although primarily driven by the authors' own research in these areas, every chapter will provide ample connections to relevant research from the wider literature. The technical topics covered in the book are self-contained and are accessible to readers with a basic background in AI.

**Artificial Intelligence in Chemical Engineering** Thomas E. Quantrille, Yih An Liu, 1991  
Artificial intelligence (AI) is the part of computer science concerned with designing intelligent computer systems that exhibit characteristics we associate with intelligence in human behavior. This book is the first published textbook of AI in chemical engineering and provides broad and in-depth coverage of AI programming, AI principles, expert systems, and neural networks in chemical engineering. This book introduces the computational means and methodologies that are used to enable computers to perform intelligent engineering tasks. A key goal is to move beyond the principles of AI into its applications in chemical engineering. After reading this book, a chemical engineer will have a firm grounding in AI, know what chemical engineering applications of AI exist today, and understand the current challenges facing AI in engineering. Key Features: Allows the reader to learn AI quickly using inexpensive personal computers. Contains a large number of illustrative examples, simple exercises, and complex practice problems and solutions. Includes a computer diskette for an illustrated case study. Demonstrates an expert system for separation synthesis (EXSEP). Presents a detailed review of published literature on expert systems and neural networks in chemical engineering.

**Cognitive Semantics of Artificial Intelligence: A New Perspective** Alexander Raikov, 2021-02-02  
This book addresses the issue of cognitive semantics, aspects that cannot be represented by traditional digital and logical means. The problem of creating cognitive semantics can be resolved in an indirect way. The electromagnetic waves, quantum fields, beam of light, chaos, control, relativistic theory, cosmic string, recognition, category theory, group theory, and so on, can be used for this aim. Since the term artificial intelligence (AI) appeared, various versions of logic have been created, many heuristics for neural networks, deep learning have been made, new nature-like algorithms have been suggested. At the same time, the initial digital, logical, and neural network principles of representation of knowledge in AI systems have not changed a lot. The researches of these aspects of cognitive semantics of AI are based on the author's convergent methodology, which provides the necessary conditions for purposeful and sustainable convergence of decision making.
