Autotuning Of Pid Controllers:

Autotuning of PID Controllers Cheng-Ching Yu, 2006-05-11 Recognising the benefits of improved control the second edition of Autotuning of PID Controllers provides simple yet effective methods for improving PID controller performance The practical issues of controller tuning are examined using numerous worked examples and case studies in association with specially written autotuning MATLAB programs to bridge the gap between conventional tuning practice and novel autotuning methods The extensively revised second edition covers Derivation of analytical expressions for relay feedback responses Shapes of relay responses and improved closed loop control and performance assessment Autotuning for handling process nonlinearity in multiple model based cases The impact of imperfect actuators on controller performance This book is more than just a monograph it is an independent learning tool applicable to the work of academic control engineers and of their counterparts in industry looking for more effective process control and automation *Autotuning of PID Controllers*

Cheng-Ching Yu, 2013-04-17 Recognising the benefits of improved control this book aims to provide simple and yet effective methods of improving controller performance It bridges the gap between the conventional tuning practice and new generations of autotuning methods Practical issues facing controller tuning are treated such as measurement noises process nonlinearity load disturbances and multivariable interaction and tools are also given Numerous worked examples and case studies are used to illustrate the autotuning procedure and MATLAB programs to execute autotuning steps are given This book is intended to be an independent learning tool and is particularly invaluable to practitioners and scientist as well as graduate and undergraduate students The reader will therefore find it useful particularly as it is applicable to engineering practice **Towards Real Time Optimal Auto-tuning of PID Controllers** Aaron Jamison Hill, 2014

The Proportional Integral Derivative PID controller has been widely used by the process control industry for many years Design methods for PID Controllers are mature and have been heavily researched and evaluated For most of its modern history the Ziegler Nichols methods have been used for tuning PID controllers into desired operating conditions Recently automatic tuning methods have been formulated and used to generate stable PID controlled systems These methods have also been implemented on real time systems However the use of optimal methods for auto tuning PID controllers on real time systems has not seen much discussion In this thesis we explore the applicability of optimal PID design methods from Datta Ho and Bhattacharyya to real time system control The design method is based on a complete characterization of the set of stabilizing PID parameters for various plant models and a subsequent search over the stabilizing set for the optimal controller A full implementation of the algorithms is completed on an embedded system with DSP hardware These implementations are then tested against a large number of examples to determine both accuracy and applicability to real time systems The major design constraint for application of these algorithms to real time systems is computation time The faster the optimal result can be computed the more applicable the algorithm is to a real time environment In order to bring each of these algorithms

into a real time system fast search algorithms were developed to quickly compute the optimal result for the given performance criterion Three different search methods were developed compared and analyzed The first method is a brute force search used as a basis to compare the two additional fast search methods The two faster search methods prove to be vastly superior in determining the optimal result with the same level of accuracy as brute force search but in a greatly reduced time These search methods achieve their superior speeds by reducing the search space without sacrificing accuracy of the results With these two fast search methods applied to the complete characterization of stabilizing PID controllers application to real time systems is achieved and demonstrated through examples of various performance criteria The electronic version of this dissertation is accessible from <http://hdl.handle.net/1969/1/151639>
