

DIELECTRIC BEHAVIOR OF MATERIALS

- Difficult to excite electrons from valence to conduction band by thermal means or by applied electric field.
- Very poor conductor of electricity
- Exhibits or may be made to exhibit an **electric dipole structure**; that is, there is a separation of positive and negative electrically charged entities on a molecular or atomic level.

CAPACITANCE

When a voltage is applied across a capacitor, one plate becomes positively charged, the other negatively charged, with the corresponding electric field directed from the positive to the negative.

$$C = \frac{Q}{V}$$

Q = quantity of charge stored on either plate
 V = voltage applied across the capacitor
