Coronavirus Replication and Reverse Genetics Luis Enjuanes,2005-10-25 Human coronaviruses caused the SARS epidemic that infected more than 8000 people killing about ten percent of them in 32 countries This book provides essential information on these viruses and the development of vaccines to control coronavirus infections **Coronavirus**

Replication and Reverse Genetics Luis Enjuanes,2005 Coronaviruses are the RNA viruses with the largest genome known to date 27 to 32 kb Members of this virus family affect most domestic animal species causing important socio economical losses and also infect humans Human coronaviruses were known to cause the winter common cold a mild infection without important pathological consequences except in immuno compromised patients Recently two new human coronaviruses have emerged one causing the Severe and Acute Respiratory Syndrome SARS that infected more than 8000 individuals leading to more than 800 deaths in 32 countries This epidemic mobilized the World Health Organization which launched travel restrictions to certain parts of the world for the first time in the last 50 years The fact that coronaviruses as many other viruses crossed the species barrier to infect humans has posed a serious challenge to scientists involved in animal and human health Control of coronavirus induced diseases can only be the consequence of research on virus molecular biology and pathogenesis This book contains information on virus genome structure mechanism of replication and transcription and the development of tools that make possible reverse genetic studies to understand virus host interactions and the molecular basis of virus pathogenesis The book also provides essential information for the development of classical and recombinant vaccines to control coronavirus infections **Coronavirus Replication and Reverse Genetics** Luis Enjuanes,2004-10-05
