Cardiac Mapping: Approaches from an Engineering Perspective Ying-Chu Lo, 2010 The prevalence of atrial fibrillation has increased significantly Several focal areas within the heart which trigger atrial fibrillation have been identified by physicians There are a number of ways to lessen and treat atrial fibrillation Ablating the focal areas is one of the therapies to alleviate or stop the symptoms especially using radiofrequency as an energy source to perform the ablation Before performing the radiofrequency ablation an electrophysiologist needs to acquire cardiac information in as much detail as possible This information includes heart surface geometry electrical activation sequences electrical activities times and volumes etc A successful radiofrequency ablation requires precise cardiac geometry reconstruction and accurate focal areas localization A number of novel computer aided 3 dimension cardiac reconstruction mapping technologies are able to integrate with Computed Tomography CT Magnetic Resonance Imaging MRI and body surface ECG to provide comprehensive cardiac anatomical structures and information to users during the overall ablation procedure These cardiac mapping systems also provide real time cardiac information to

operators and identify the complex fractionated atrial electrograms CFAEs for ablation purposes The principles of fluoroscopy based cardiac images heart surface reconstruction are reviewed An optimization algorithm Hill climbing algorithm is introduced to approach and identify the CFAEs *Perioperative Cardiac Dysrhythmias* John L.
