

Chapter 4: Latin America

Read the corresponding book chapter(s) and review the Module resources in preparation for the final exam.

OUTLINE

Introduction and Overview: the modern states of Latin America are multiethnic, with distinct indigenous and immigrant profiles and very different rates of social and economic development; the concept of Latin America as a distinct region has been popularly accepted for nearly a century; we define Latin America as the Iberian dominated countries of mainland Middle America and South America; through colonialism, immigration, and trade, the forces of globalization have been embedded in the Latin American landscape; Latin America is home to Earth's largest rainforest, the greatest river by volume, and massive reserves of natural gas, oil, gold, and copper; unlike most areas of the developing world, Latin America is decidedly urban; there are many megacities in the region.

I. Physical Geography and Environmental Issues: Neotropical Diversity and Urban Degradation: much of the region is characterized by its tropicality; neotropics—tropical ecosystems in the Western Hemisphere; given the region's large size and relatively low population density, it has not experienced the same levels of environmental degradation witnessed in Europe and East Asia; large areas of Latin America remain relatively untouched; region's biggest natural resource challenge is to balance economic benefits of extraction with ecological soundness of conservation

A. Western Mountain and Eastern Shields: Latin America is a region with diverse landforms, including high mountains and extensive upland plateaus (called shields); historically, most important areas of settlement were not along rivers but across its shields, plateaus, and fertile intermontane basins; these areas characterized by arable land, mild climate, and sufficient rainfall; key site is Mexican Plateau, a massive upland area ringed by Sierra Madre Mountains—Valley of Mexico is located at southern end of plateau

- 1. The Andes:** relatively young mountain range stretching from northwestern Venezuela and ending at Tierra del Fuego
- Created by collision of oceanic and continental plates; chain of approximately 30 peaks higher than 20,000 feet; many rich veins of precious metals and minerals
 - Andes are still forming; active volcanism and earthquakes
 - Mountain chain typically divided into northern, central, and southern components; in Colombia, northern Andes further split into three distinct mountain ranges; high-altitude plateaus and snow-covered peaks distinguish central Andes of Ecuador, Peru, and Bolivia—especially important is the Altiplano, a treeless high plain located in Peru and Bolivia that is home to Lake Titicaca and Lake Poopo; Southern Andes shared by Chile and Argentina
