Exact and Approximate Analysis of Queueing Network Models with Blocking George Dimitri Tsiotras,1986

Arbitrary Queueing Network Models with Blocking and Server Vacations Charalabos Skianis,1997 Over the recent years queueing network models with finite capacity are widely recognised as powerful evaluation tools for representing computer communication and flexible manufacturing systems and predicting their performance Exact closed form solutions are not generally attainable in the field which fuels the development of numerical techniques and analytic approximations This thesis addresses the phenomenon of queueing networks with blocking where the server takes on vacations and studies their performance both at the node and at the network level by proposing a cost effective decomposition algorithm based on a new product form approximation suggested by the information theoretic principle of minimum relative entropy Based on the aforementioned analysis an approximate algorithm is proposed for the performance evaluation of a shared medium ATM switch architecture

Performance Analysis of Closed Queueing Networks Svenja Lagershausen,2012-10-24 This book deals with the performance analysis of closed queueing networks with general processing times and finite buffer spaces It offers a detailed introduction to the problem and a comprehensive literature review Two approaches to the performance of closed queueing networks are presented One is an approximate decomposition approach while the second is the first exact approach for finite capacity networks with general processing times In this Markov chain approach queueing networks are analyzed by modeling the entire system as one Markov chain As this approach is exact it is well suited both as a reference quantity for approximate procedures and as extension to other queueing networks Moreover for the first time the exact distribution of the time between processing starts is provided

General Queueing Networks with Blocking Nicholas P. Xenios,1989

Introduction to Queueing Networks J. MacGregor Smith,2018-08-28 The book examines the performance and optimization of systems where queueing and congestion are important constructs Both finite and infinite queueing systems are examined Many examples and case studies are utilized to indicate the breadth and depth of the queueing systems and their range of applicability Blocking of these processes is very important and the book shows how to deal with this problem in an effective way and not only compute the performance measures of throughput cycle times and WIP but also to optimize the resources within these systems The book is aimed at advanced undergraduate graduate and professionals and academics interested in network design queueing performance models and their optimization It assumes that the audience is fairly sophisticated in their mathematical understanding although the explanations of the topics within the book are fairly detailed

An Introduction to Queueing Systems Sanjay K. Bose,2013-12-01 Queueing is an aspect of modern life that we encounter at every step in our daily activities Whether it happens at the checkout counter in the supermarket or in accessing the Internet the basic phenomenon of queueing arises whenever a shared facility needs to be accessed for service by a large number of jobs or customers The study of queueing is important as it provides both a theoretical background to the kind of service that we may expect from such a facility and the way in which the facility itself may be designed to provide some specified grade of service to its customers Our study of queueing was basically motivated by its use in the study of communication systems and computer networks The various computers routers and switches in such a network may be modelled as individual queues The whole system may itself be modelled as a queueing network providing the required service to the messages packets or cells that need to be carried Application of queueing theory provides the theoretical framework for the design and study of such networks The purpose of this book is to support a course on queueing

systems at the senior undergraduate or graduate levels. Such a course would then provide the theoretical background on which a subsequent course on the performance modeling and analysis of computer networks may be based.

Performance Evaluation of Computer and Communication Systems Lorenzo Donatiello, Randolph

Nelson, 1993-09-15 This volume contains the complete set of tutorial papers presented at the 16th IFIP International Federation for Information Processing Working Group 7.3 International Symposium on Computer Performance Modelling Measurement and Evaluation and a number of tutorial papers presented at the 1993 ACM Association for Computing Machinery Special Interest Group METRICS Conference on Measurement and Modeling of Computer Systems. The principal goal of the volume is to present an overview of recent results in the field of modeling and performance evaluation of computer and communication systems. The wide diversity of applications and methodologies included in the tutorials attests to the breadth and richness of current research in the area of performance modeling. The tutorials may serve to introduce a reader to an unfamiliar research area, to unify material already known, or simply to illustrate the diversity of research in the field. The extensive bibliographies guide readers to additional sources for further reading.

Queueing Network Models with Blocking and Multiple Job Classes Spiridon G. Denazis, 1993

Recent advances in the area of high speed networks reveal that congestion becomes an important issue for their performance, giving thus rise to the phenomenon of blocking. This is mainly attributed to the burstiness of traffic that is expected to flow through the network. These networks referred to under the generic term as Broadband Integrated Service Digital Networks (B-ISDN) are targeted to efficiently deliver a diversity of services requested by different classes of customers. To this end, the Asynchronous Transfer Mode (ATM) is put forward as the specific packet-oriented transfer mode solution for B-ISDN. This thesis addresses the phenomenon of blocking inherent to these network systems and studies their performance both at the node and network level by proposing a new methodology for the approximate analysis of queueing network models of computer communication systems with finite capacities, complete sharing buffer management scheme, and different types of building block queues with multiple classes of customers using entropy maximisation and the generalised exponential distribution.
