**The Correctness Problem in Computer Science** Robert S. Boyer, J Strother Moore, 1981 *The Correctness Problem in Computer Science* Robert S Boyer, J. Strother Moore, 1981 Constructive Methods in Computing Science Manfred Broy, 2012-12-06 Computing Science is a science of constructive methods The solution of a problem has to be described formally by constructive techniques if it is to be evaluated on a computer The Marktoberdorf Advanced Study Institute 1988 presented a comprehensive survey of the recent research in constructive methods in Computing Science Some approaches to a methodological framework and to supporting tools for specification development and verification of software systems were discussed in detail Other lectures dealt with the relevance of the foundations of logic for questions of program construction and with new programming paradigms and formalisms which have proven to be useful for a constructive approach to software development The construction specification design and verification especially of distributed and communicating systems was discussed in a number of complementary lectures Examples for those approaches were given on several levels such as semaphores nondeterministic state transition systems with fairness assumptions decomposition of specifications for concurrent systems in liveness and safety properties and functional specifications of distributed systems Construction methods in programming that were presented range from type theory the theory of evidence theorem provers for proving properties of functional programs to category theory as an abstract and general concept for the description of programming paradigms The Second Age of Computer Science Subrata Dasgupta, 2018 Between the genesis of computer science in the 1960s and the advent of the World Wide Web around 1990 computer science evolved in significant ways The author has termed this period the second age of computer science This book describes its evolution in the form of several interconnected parallel histories **Elegant Solutions to Computer Science Problems**, Readings in Artificial Intelligence and Software Engineering Charles Rich, Richard C. Waters, 2014-06-28 Readings in Artificial Intelligence and Software Engineering covers the main techniques and application of artificial intelligence and software engineering The ultimate goal of artificial intelligence applied to software engineering is automatic programming Automatic programming would allow a user to simply say what is wanted and have a program produced completely automatically This book is organized into 11 parts encompassing 34 chapters that specifically tackle the topics of deductive synthesis program transformations program verification and programming tutors The opening parts provide an introduction to the key ideas to the deductive approach namely the correspondence between theorems and specifications and between constructive proofs and programs These parts also describes automatic theorem provers whose development has been designed for the programming domain The subsequent parts present generalized program transformation systems the problems involved in using natural language input the features of very high level languages and the advantages of the programming by example system Other parts explore the intelligent assistant approach and the significance and relation of programming knowledge in other programming system The

concluding parts focus on the features of the domain knowledge system and the artificial intelligence programming Software engineers and designers and computer programmers as well as researchers in the field of artificial intelligence will find this book invaluable

Baber,1987 Every engineering field is founded on a body of fundamental scientific and mathematical principles providing a basis for the design process and enabling designers to systematically validate the major characteristics of a proposed system In recent years computing science has generated a similar body of principles allowing software engineers to design error free programs This book presents this core of knowledge The concepts covered are based on the view that a variable is a triple of a name a set and an element of that set a value that a data environment the execution of a program is a sequence of variables and that a statement subprogram or program serves to map a data environment into another data environment While the material is treated in a mathematically rigorous fashion it is carefully written to show software developers how to apply theory to practical design tasks *The*
