Computational Methods For Controller Design:

Computational Methods for Controller Design Nicola Elia, Munther A. Dahleh, 2014-03-12 The monograph is concerned with computational methods for controller design that allow several typical performance specifications to be directly imposed on a system. The general approach proposed is applicable to a large class of problems; it is based on posing multi-objective control problems as convex infinite-dimensional optimization problems. Particularly interesting and useful are the following methodological aspects of the approach proposed in the monograph: These are: A unified way to pose the problems as generalized linear programs; Duality theory results that characterize the duality relationship for the generalized linear programs arising from multi-objective control problems; A set of tools to analyse the convergence properties of the computational method based on the duality relationship; The complete analysis and extension of methods developed for the L1 problem for several important multi-objective problems. This book is primarily concerned with multi-objective control problems as convex optimizations on the space of the closed-loop maps. However, the issue of deriving exact or approximate solutions is similar when the problems are posed as dynamic games in state space. Therefore, the problem of finding the state-feedback controller that minimizes the worst-case peak-to-peak amplification of the closed-loop system is considered in the last chapter. The objective of this work is to propose generic computation methods that can be used to solve a wide range of multi-objective control problems. Infinite-dimensional convex optimization problems are considered, giving the book a broader focus than other competitive titles in this field. This non-exclusive approach will have a wide appeal for scientists and graduate students. They will be able to determine and analyse readily implementable computational methods to derive exact or approximate solutions. Key words for the catalogue index: Controller design, multi-objective control, computational methods, linear programming, robust control, USPs. Generic computational methods are proposed; these can be used to solve a wide range of multi-objective control problems. A new computational method for the L1 problem is suggested, which is superior to existing approaches and is based on the solution of a mixed objective problem. The reader will greatly benefit from the comprehensive treatment of this topic.

Computational Methods for Optimal Design and Control J. Borggaard, John Burns, Scott Schreck, 1998-10-23 This volume contains the proceedings of the Second International Workshop on Optimal Design and Control held in Arlington, Virginia, 30 September–3 October 1997. The First Workshop was held in Blacksburg, Virginia, in 1994. The proceedings of that meeting also appeared in the Birkhäuser series on Progress in Systems and Control Theory and may be obtained through Birkhäuser. These workshops were sponsored by the Air Force Office of Scientific Research through the Center for Optimal Design and Control (CODAC) at Virginia Tech. The meetings provided a forum for the exchange of new ideas and were designed to bring together diverse viewpoints and to highlight new applications. The primary goal of the workshops was to assess the current status of research and to analyze future directions in optimization-based design and control. The present volume contains the technical papers presented at the Second Workshop. More than 65

participants from 6 countries attended the meeting and contributed to its success It has long been recognized that many modern optimal design problems are best viewed as variational and optimal control problems Indeed the famous problem of determining the body of revolution that produces a minimum drag nose shape in hypersonic flow was first proposed by Newton in 1686 Optimal control approaches to design can provide theoretical and computational insight into these problems This volume contains a number of papers which deal with computational aspects of optimal control Computational Methods and Experimental Measurements XIX & Earthquake Resistant Engineering Structures XII P.
