Applied Highresolution Geophysical Methods:

Applied High-Resolution Geophysical Methods P.K. Trabant,2013-11-27 The discipline encompassing the use of high resolution geophysics for obtaining geoengineering survey data has evolved rapidly over the past decades to become an interdisciplinary subject encompassing the fields of Geophysics engineering geology marine geology oceanography and civil engineering While high resolution geophysical surveys are routinely performed offshore today this has been so only since the late 1960s High resolution geophysical methods are employed in the offshore environment to obtain a comprehensive picture of the sea floor morphology and underlying shallow stratigraphy The purpose of the survey methods is to assist in the design and installation of bottom supported structures such as drilling and production platforms and pipelines Drilling structures and pipelines of steel and or concrete have become behemoths with respect to their size and the complexity of their design in order to withstand for periods of up to twenty five years an extremely harsh environment including storm waves strong currents unstable sea floor conditions and great water depths It is therefore of paramount importance that the geometry and physical properties of the sea floor be well understood in order to provide an adequate foundation for the design lives of such structures On land engineering foundation data usually may be obtained by visual field inspection and shallow borehole information but offshore the presence of the water column places certain constraints on geoengineering investigations High resolution geophysical methods employed in the acquisition of geoengineering data offshore are defined as the use of seismic sources and receivers that operate at acoustic frequencies greater than 100 Hz

Benson, Lynn B. Yuhr, 2015-09-24 This book provides a practical strategy for obtaining a more complete and accurate geologic site characterization The strategy and methods to characterize complex geologic settings are readily available The strategy utilizes readily available technology basic science and good old fashioned common sense resulting in a solid understanding of geologic and even karst or pseudokarst conditions We provide an introduction to many off the shelf methods available for site characterization as well as examples of their application throughout the book The purpose of a geologic site characterization is to understand the 3 dimensional geologic framework along with the engineering and hydrologic properties of a site including any man made impacts A well done site characterization is the cornerstone of all geotechnical groundwater and environmental projects The geologic conditions particularly karst conditions can significantly impact a site including its structural stability groundwater pathways and potential for rapid transport or traps for contaminants Once we have adequately characterized the geologic conditions can we carry our remediation design and construction model flow and make risk assessments that are accurate and reliable
