Databases And Mobile Computing:

Data Management for Mobile Computing Evaggelia Pitoura, George Samaras, 2012-12-06 Earth date August 11 1997
Beam me up Scottie We cannot do it This is not Star Trek s Enterprise This is early years Earth True this is not yet the era of Star Trek we cannot beam captain James T Kirk or captain Jean Luc Picard or an apple or anything else anywhere What we can do though is beam information about Kirk or Picard or an apple or an insurance agent We can beam a record of a patient the status of an engine a weather report We can beam this information anywhere to mobile workers to field engineers to a track loading apples to ships crossing the Oceans to web surfers We have reached a point where the promise of information access anywhere and anytime is close to realization The enabling technology wireless networks exists what remains to be achieved is providing the infrastructure and the software to support the promise Universal access and management of information has been one of the driving forces in the evolution of computer technology Central computing gave the ability to perform large and complex computations and advanced information manipulation Advances in networking connected computers together and led to distributed computing Web technology and the Internet went even further to provide hyper linked information access and global computing However restricting access stations to physical location limits the boundary of the vision

Replicated Data Management for Mobile Computing Terry Douglas, 2008-06-08 Managing data in a mobile computing environment invariably involves caching or replication. In many cases a mobile device has access only to data that is stored locally and much of that data arrives via replication from other devices, PCs and services. Given portable devices with limited resources, weak or intermittent connectivity and security vulnerabilities, data replication serves to increase availability, reduce communication costs, foster sharing and enhance survivability of critical information. Mobile systems have employed a variety of distributed architectures from client server caching to peer to peer replication. Such systems generally provide weak consistency models in which read and update operations can be performed at any replica without coordination with other devices. The design of a replication protocol then centers on issues of how to record, propagate, order and filter updates. Some protocols utilize operation logs whereas others replicate state. Systems might provide best effort delivery using gossip protocols or multicast or guarantee eventual consistency for arbitrary communication patterns using recently developed pairwise knowledge driven protocols. Additionally, systems must detect and resolve the conflicts that arise from concurrent updates using techniques ranging from version vectors to read write dependency checks. This lecture explores the choices faced in designing a replication protocol with particular emphasis on meeting the needs of mobile applications. It presents the inherent trade offs and implicit assumptions in alternative designs. The discussion is grounded by including case studies of research and commercial systems including Coda, Ficus, Bayou, Sybase's iAnywhere and Microsoft's Sync Framework.

Mobile Data Management Kian-Lee Tan, Michael J. Franklin, John C.-S. Lui, 2003-06-29

Welcome to the Second International Conference on Mobile Data Management (MDM2001). The conference serves as a forum for the exchange of technical ideas and research results in the areas of mobility and database management. This year we have a very exciting program for MDM2001. Many quality papers were submitted to the conference. All of the submitted papers were viewed by at least three PC members. Due to the limitations of the program schedule as well as the desire to organize the conference using a single track format, we selected only 18 papers for full presentation at the conference. As a result, many excellent papers could not be accepted. The papers chosen for presentation span a large range of topics from network protocol issues up to the semantics of mobile applications. The common theme of all these papers is their recognition of the central role played by data management techniques in the development of the emerging world of mobile and wireless applications. We have loosely organized these papers into six areas: 1. DATA MANAGEMENT ARCHITECTURES, 2. CONTENT DELIVERY, 3. DATA BROADCASTING, 4. CACHING AND HOARDING, 5. COPING WITH MOVEMENT, 6. NETWORKS AND SYSTEMS ISSUES. In addition to the research track, we have sought to broaden the scope of the conference with an industrial session as well as poster presentations. Overall, the program strikes a comfortable balance between applied and theoretically oriented papers.

Mobile Computing Tomasz Imielinski, Henry F. Korth, 2007-08-26 The rapid development of wireless digital communication technology has cre ated capabilities that software systems are only beginning to exploit The falling cost of both communication and of mobile computing devices laptop computers hand held computers etc is making wireless computing affordable not only to business users but also to consumers Mobile computing is not a scaled down version of the established and we studied field of distributed computing The nature of wireless communication media and the mobility of computers combine to create fundamentally new problems in networking operating systems and information systems Further more many of the applications envisioned for mobile computing place novel demands on software systems Although mobile

computing is still in its infancy some basic concepts have been identified and several seminal experimental systems developed This book includes a set of contributed papers that describe these concepts and systems Other papers describe applications that are currently being deployed and tested The first chapter offers an introduction to the field of mobile computing a survey of technical issues and a summary of the papers that comprise subsequent chapters We have chosen to reprint several key papers that appeared previously in conference proceedings Many of the papers in this book are being published here for the first time Of these new papers some are expanded versions of papers first presented at the NSF sponsored Mobidata Workshop on Mobile and Wireless Information Systems held at Rutgers University on Oct 31 and Nov 1 1994

Multidatabases in the Mobile-computing Environment C. Chahadeh, A. R. Hurson, M. Kavehrad, 1997 Abstract The multidatabase system has proved to be efficient in managing information sharing and integration from multiple preexisting heterogeneous databases Its effectiveness lies in the fact that it provides the global user with transparent methods for accessing data from the federation of databases with a single query Furthermore advances in technology and communication have made the realization of a mobile nomadic computing environment a reality Users are capable of accessing computer networks using portable computing devices via a wireless connection and while mobile By superimposing the mobile computing environment onto the multidatabase system a new computing environment is attained This new environment is the multidatabase system enhanced with a new breed of clients These clients are mobile communicate in a wireless format and are characterized by limited resources and energy sources In this work we investigate the effects introduced by the characteristics of the mobile computing environment onto the multidatabase systems More specifically we pinpoint a number of multidatabase system issues impacted by mobile computing for each of the affected issues we analyze the challenges that are brought about and present possible solutions
