## **Combinatorial Index:**

*The Combinatorial Index* Barry A. Bunin, 1998-04-15 With the explosion of combinatorial solid phase methods access to information has become one of the main barriers facing a synthetic chemist who is contemplating a combinatorial approach to a medicinal chemistry problem The Combinatorial Index is an answer to that problem This compendium of methods from the primary literature provides quick and convenient access to reliable synthetic transformations as well as information on linkers and analytical methods Each synthetic procedure is preceded by a section entitled Points of Interest which highlights the strengths and weaknesses of the various studies The index also covers the use of solution based synthesis for the generation of molecular diversity Organized for rapid retrieval of published information on classes of synthetic transformations linkers and analytical methods Serves as a laboratory manual for bench chemists Includes a chapter on linkers to assist in choice of linking strategy Discusses strengths and limitations of the various methods Contains a structural index showing functional group transformations in solid phase synthesis

**Advances in Applied and Computational Topology** American Mathematical Society. Short Course on Computational Topology, 2012-07-05 What is the shape of data How do we describe flows Can we count by integrating How do we plan with uncertainty What is the most compact representation These questions while unrelated become similar when recast into a computational setting Our input is a set of finite discrete noisy samples that describes an abstract space Our goal is to compute qualitative features of the unknown space It turns out that topology is sufficiently tolerant to provide us with robust tools This volume is based on lectures delivered at the 2011 AMS Short Course on Computational Topology held January 4 5 2011 in New Orleans Louisiana The aim of the volume is to provide a broad introduction to recent techniques from applied and computational topology Afra Zomorodian focuses on topological data analysis via efficient construction of combinatorial structures and recent theories of persistence Marian Mrozek analyzes asymptotic behavior of dynamical systems via efficient computation of cubical homology Justin Curry Robert Ghrist and Michael Robinson present Euler Calculus an integral calculus based on the Euler characteristic and apply it to sensor and network data aggregation Michael Erdmann explores the relationship of topology planning and probability with the strategy complex Jeff Erickson surveys algorithms and hardness results for topological optimization problems

**Rigorous Numerics in Dynamics** Jan Bouwe van den Berg, Jean-Philippe Lessard, 2018-07-12 This volume is based on lectures delivered at the 2016 AMS Short Course Rigorous Numerics in Dynamics held January 4 5 2016 in Seattle Washington Nonlinear dynamics shapes the world around us from the harmonious movements of celestial bodies via the swirling motions in fluid flows to the complicated biochemistry in the living cell Mathematically these phenomena are modeled by nonlinear dynamical systems in the form of ODEs PDEs and delay equations The presence of nonlinearities complicates the analysis and the difficulties are even greater for PDEs and delay equations which are naturally defined on infinite dimensional function spaces With the availability of powerful computers and sophisticated software

numerical simulations have quickly become the primary tool to study the models. However, while the pace of progress increases, one may ask just how reliable are our computations. Even for finite dimensional ODEs, this question naturally arises if the system under study is chaotic, as small differences in initial conditions such as those due to rounding errors in numerical computations yield wildly diverging outcomes. These issues have motivated the development of the field of rigorous numerics in dynamics, which draws inspiration from ideas in scientific computing, numerical analysis, and approximation theory. The articles included in this volume present novel techniques for the rigorous study of the dynamics of maps via the Conley index theory, periodic orbits of delay differential equations via continuation methods, invariant manifolds, and connecting orbits, the dynamics of models with unknown nonlinearities, and bifurcation diagrams.
