

Configurable Computing Architectures

- Configurable Computing architectures combine elements of general-purpose computing and application-specific integrated circuits (ASICs).
 - The general-purpose processor operates with fixed circuits that perform multiple tasks under the control of software.
 - An ASIC contains circuits specialized to a particular task and thus needs little or no software to instruct it.
- The configurable computer can execute software commands that alter its configurable devices (e.g. FPGA circuits) as needed to perform a variety of jobs.

Introduction to Reconfigurable Computing Christophe Bobda, 2007-09-30 Introduction in Reconfigurable Computing provides a comprehensive study of the field Reconfigurable Computing It provides an entry point to the novice willing to move in the research field reconfigurable computing FPGA and system on programmable chip design The book can also be used as teaching reference for a graduate course in computer engineering or as reference to advance electrical and computer engineers It provides a very strong theoretical and practical background to the field of reconfigurable computing from the early Estrin s machine to the very modern architecture like coarse grained reconfigurable device and the embedded logic devices Apart from the introduction and the conclusion the main chapter of the book are the following Architecture of reconfigurable systems which presents the technology and the architecture used in fined grained and those used in coarse grained reconfigurable devices Design and implementation This section deals with the implementation on reconfigurable system It briefly covers the steps needed to implement application on today s FPGAs And focus on the logic synthesis for FPGA in particular LUT technology mapping High Level Synthesis for Reconfigurable Devices The high level synthesis for reconfigurable systems also known as temporal partitioning is presented here Several temporal partitioning techniques are presented and explained Temporal placement This section considers stand alone reconfigurable systems Its assume that a

kind of operating systems for reconfigurable systems is in charge of managing the resources of a given system and allocate space on a device for the computation of incoming tasks and therefore presents several temporal placement approaches for off line as well as on line placement On line and Dynamic Interconnection This chapter reviews and explains the different approaches for allowing communication between modules dynamically placed at run time on a given device Designing a reconfigurable application on Xilinx Virtex FPGA In this section the different design approaches of partial reconfigurable systems on the Xilinx FPGAs that are one of the few one on the market with this feature is explained System on programmable chip System on programmable chip is a hot topic in reconfigurable computing This is mainly the integration of a system made upon some peripheral UART Ethernet VGA etc but also computational Coding filter etc hardware modules on one programmable chip The current usable solutions are presented The book furthermore focusses on the development of adaptive multiprocessors on chip i e systems consisting of a set of Processors and exchangeable hardware accelerators Applications This part covers the use of reconfigurable system in computer architecture rapid prototyping reconfigurable supercomputer reconfigurable massively parallel computers and algorithm better adapted for reconfigurable systems distributed arithmetic network packet processing etc
