Discrete-event System Theory An Introduction:

Discrete-event System Theory Antonio Tornambe, 1995 *Discrete-event System Theory* Antonio Tornambe, 1995 This book provides a clear understandable and motivated account on the subject that spans both conventional and modern materials about discrete event systems material that up to now has been presented in the literature in different fields such as the graph theory the probability theory the automata theory and the queueing theory The book gives a complete introduction to the discrete event system theory and simultaneously applies the theory to practical problems The book gives students of computer sciences system sciences and of electrical engineering a clear unambiguous and relevant account of discrete event systems Numerous illustrations are included for better understanding Problems as well as their solutions are included in each chapter It can be used as a basic introduction for undergraduates and graduate students Although it is logically self contained it presupposes the mathematical maturity acquired by students with two years of calculus

Introduction to Discrete Event Systems Christos G. Cassandras, Stéphane Lafortune, 2013-04-17 A substantial portion of this book is a revised version of *Discrete Event Systems Modeling and Performance Analysis* 1993 which was written by the first author and received the 1999 Harold Chestnut Prize awarded by the International Federation of Automatic Control IFAC for best control engineering textbook This new expanded book is a comprehensive introduction to the field of discrete event systems emphasizing breadth of coverage and accessibility of the material to readers with different backgrounds Its key feature is the emphasis placed on a unified modeling framework that transcends specific application areas and allows linking of the following topics in a coherent manner language and automata theory supervisory control Petri net theory max algebra Markov chains and queueing theory discrete event simulation perturbation analysis and concurrent estimation techniques *Introduction to Discrete Event Systems* will be of interest to advanced level students in a variety of disciplines where the study of discrete event systems is relevant control communications computer engineering computer science manufacturing engineering operations research and industrial engineering **Systems: Theory and Practice** Rudolf Albrecht, 2012-12-06 There is hardly a science that is without the notion of system We have systems in mathematics formal systems in logic systems in physics electrical and mechanical engineering architectural operating information programming systems in computer science management and production systems in industrial applications economical ecological biological systems and many more In many of these disciplines formal tools for system specification construction verification have been developed as well as mathematical concepts for system modeling and system simulation Thus it is quite natural to expect that systems theory as an interdisciplinary and well established science offering general concepts and methods for a wide variety of applications is a subject in its own right in academic education However as can be seen from the literature and from the curricula of university studies at least in Central Europe it is subordinated and either seen as part of mathematics with the risk that mathematicians who may not be familiar with applications define it in their own way or it is treated separately

within each application field focusing on only those aspects which are thought to be needed in the particular application This often results in uneconomical re inventing and re naming of concepts and methods within one field while the same concepts and methods are already well introduced and practiced in other fields The fundamentals on general systems theory were developed several decades ago We note the pioneering work of M A Arbib R E Kalman G I Klir M D Realization and Modelling in System Theory A.C. Ran, J.H. van Schuppen, Marinus Kaashoek, 2013-03-07 This volume is the first of the three volume publication containing the proceedings of the 1989 International Symposium on the Mathematical Theory of Networks and Systems MTNS 89 which was held in Amsterdam The Netherlands June 19 23 1989 The International Symposia MTNS focus attention on problems from system and control theory circuit theory and signal processing which in general require application of sophisticated mathematical tools such as from function and operator theory linear algebra and matrix theory differential and algebraic geometry The interaction between advanced mathematical methods and practical engineering problems of circuits systems and control which is typical for MTNS turns out to be most effective and is as these proceedings show a continuing source of exciting advances The first volume contains invited papers and a large selection of other symposium presentations on the general theory of deterministic and stochastic systems with an emphasis on realization and modelling A wide variety of recent results on approximate realization and system identification stochastic dynamical systems discrete event systems o systems singular systems and nonstandard models IS presented Preface vi Also a few papers on applications in hydrology and hydraulics are included The titles of the two other volumes are Robust Control of Linear Sys tems and Nonlinear Control volume 2 and Signal Processing Scatter ing and Operator Theory and Numerical Methods volume 3 The Editors are most grateful to the about 300 reviewers for their help in the refereeing process The Editors thank Ms G Bijleveld and Ms **Computer Aided Systems Theory - EUROCAST '95** Franz Pichler, Roberto Moreno-Diaz, Rudolf F. Albrecht, 1996-01-24 This book presents a collection of revised refereed papers selected from the contributions to the Fifth International Workshop on Computer Aided Systems Theory EUROCAST 95 held in Innsbruck Austria in May 1995 The 42 full papers contained have been contributed by CAST theoreticians tool makers designers and appliers and reflect the full spectrum of activities in the area The papers are organized in sections on systems theory design environments complex systems design and specific applications **Theory of Modeling and Simulation** Bernard P. Zeigler, Herbert Praehofer, Tag Gon Kim, 2000-01-10 The increased computational power and software tools available to engineers have increased the use and dependence on modeling and computer simulation throughout the design process These tools have given engineers the capability of designing highly complex systems and computer architectures that were previously unthinkable Every complex design project from integrated circuits to aerospace vehicles to industrial manufacturing processes requires these new methods This book fulfills the essential need of system and control engineers at all levels in understanding modeling and simulation This book written as a true text reference has become a standard sr

graduate level course in all EE departments worldwide and all professionals in this area are required to update their skills. The book provides a rigorous mathematical foundation for modeling and computer simulation. It provides a comprehensive framework for modeling and simulation integrating the various simulation approaches. It covers model formulation, simulation, model execution, and the model building process with its key activities: model abstraction and model simplification, as well as the organization of model libraries. Emphasis of the book is in particular in integrating discrete event and continuous modeling approaches, as well as a new approach for discrete event simulation of continuous processes. The book also discusses simulation execution on parallel and distributed machines and concepts for simulation model realization based on the High Level Architecture (HLA) standard of the Department of Defense. Presents a working foundation necessary for compliance with High Level Architecture (HLA) standards. Provides a comprehensive framework for continuous and discrete event modeling and simulation. Explores the mathematical foundation of simulation modeling. Discusses system morphisms for model abstraction and simplification. Presents a new approach to discrete event simulation of continuous processes. Includes parallel and distributed simulation of discrete event models. Presents a concept to achieve simulator interoperability in the form of the DEVS Bus.

Theory of Hybrid Systems and Discrete Event Systems Anuj Puri, 1995 **Computer Aided Systems Theory - EUROCAST '97** Franz Pichler, Roberto Moreno-Diaz, 1997-11-05. This book constitutes a refereed post-workshop selection of papers presented at the 6th International Workshop on Computer Aided Systems Theory EUROCAST '97 held in Las Palmas de Gran Canaria, Spain, in February 1997. The 50 revised full papers presented were carefully selected for inclusion in the volume. The book is divided into sections on design environments and tools, theory and methods, engineering systems, intelligent systems, signal processing, and specific methods and applications.

Discrete Event Systems Christos G. Cassandras, 1993 Proceedings of the International Symposium on Manufacturing Science and Technology for the 21st Century Zhou Zhaoying, 1994 Monitoring and Control of Centralized and Decentralized Partially-observed Discrete-event Systems Tae-Sic Yoo, 2002 Computer Aided Systems Theory - EUROCAST '89 Franz Pichler, Roberto Moreno-Diaz, 1990-02-07. Nonlinear Evolution Equations and Dynamical Systems. NEEDS provides a presentation of the state of the art. Except for a few review papers, the 40 contributions are intentionally brief to give only the gist of the methods, proofs, etc., including references to the relevant literature. This gives a handy overview of current research activities. Hence, the book should be equally useful to the senior researcher as well as the colleague just entering the field. Key points treated are: i) integrable systems in multidimensions and associated phenomenology; ii) criteria and tests of integrability, e.g., Painlevé test; iii) new developments related to the scattering transform; iv) algebraic approaches to integrable systems and Hamiltonian theory, e.g., connections with Young-Baxter equations and Kac-Moody algebras; v) new developments in mappings and cellular automata; vi) applications to general relativity, condensed matter physics, and oceanography.
