

Seeing challenge

## Learning to See

You won't like this exercise. You will think it's designed to fool you, frustrate you, or leave you confused. Take two groups of people and make the shape shown in figure 23. The exercise is designed to test your throwing skills as much as your seeing skills.

Here are some pots made in response to the exercise (figure 23). Assuming the potter put the clay exactly where they wanted, the pots will fail to duplicate the required shape precisely. The reason is a lack of attention to detail. They did not see the details. It shows the relationship of height to width and relationship of the parts to one another. It shows the relationship of the belly occurring midway on the bottom circumference and is made up of a curve rolling in at the shoulder for flaring out to the base. It also makes clear the similar diameter of the rim, the base, and neck.

Notice that the schematic drawing shows a slight deviation from the pot rather than a true profile. It is not so tall as a true profile, and, for that matter, potter's sketches do not show the maker's true profile either because the upper half is not placed there the work is balance throwing. In general, the potter will make judgments from true profile. Like the classical Italian Renaissance chapel ceiling, a pot needs to be judged from some of its aspects to create the desired response when seen at typical angle.

Analyzing a pot by placing it on a grid is another method used to improve the skill of accurate observation. In one case, they develop a sort of mental grid, an association of observations
